

Delphi Series H80SV, half Brick Family DC/DC Power Modules: 16.8~137.5 Vin, 54/48/24/15/12 Vout,200W

The H80SV series Half-Brick is isolated 200W DC/DC converters with 4242VDC isolation. The H80SV family comes with a host of industry-standard features, such as over current protection, over voltage protection, over temperature protection and remote on/off. All models have an ultra-wide 8:1 input voltage range (16.8V to 137.5V). With operating temperature of -40°C to +85°C, it is suitable for customers' critical applications, such as process control and automation, transportation, data communication and telecom equipment, test equipment, medical device and wherever space on the PCB is critical.

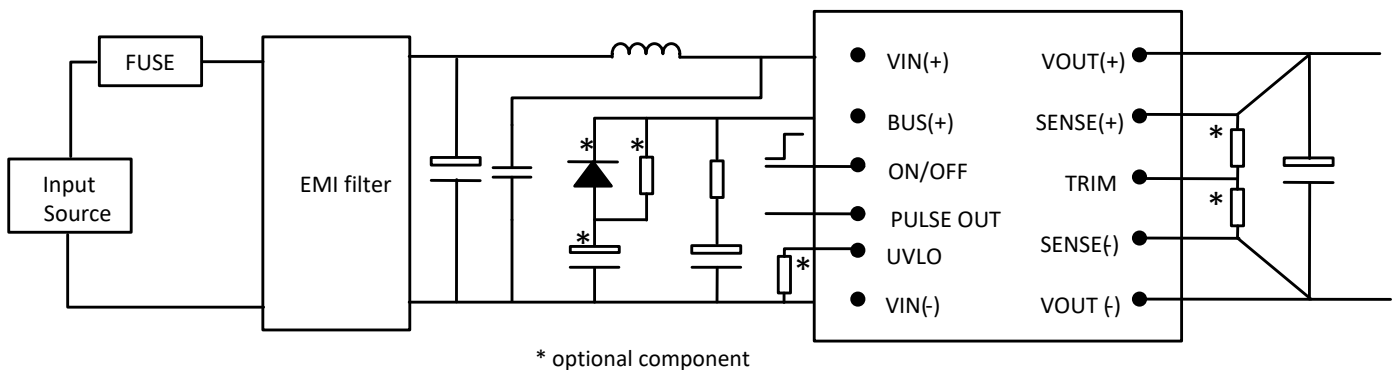

FEATURES

- Efficiency up to 92% @72Vin 15Vout
- Ultra wide input range, 16.8V-137.5V
- 14.4V/1S, 200V/1S transient voltage
- Package with Industry Standard Pinout
- Package Dimension: 63.1mm*60.6mm*13mm (2.49"*2.39"*0.51")
- OUTPUT OVP, OCP(hiccup) OTP(auto recovery)
- Positive or Negative Remote ON/OFF
- Without tantalum capacitor inside module
- Operating Base plate Temperature range - 40°C to +100°C
- 4242VDC input to output reinforced isolation
- Unit operation monitor PIN option
- A fixed frequency pulse PIN option
- Hold up time PIN option
- UVLO set up PIN option
- RoHs Compliant
- 5 Years Product Warranty
- Heat-sink is optional
- Meet requirements of EN50155
- UL60950-1, 2nd Edition certified(54V product pending)

APPLICATIONS

- ♦ Railway /Transportation system

SIMPLIFIED APPLICATION DIAGRAM

TECHNICAL SPECIFICATION

PARAMETER	NOTES and CONDITIONS	H80SV15013			
		Min.	Typ.	Max.	Units
1. ABSOLUTE MAXIMUM RATINGS					
1.1 Input Voltage	Non-operating			200	Vdc

FEATURE DESCRIPTION

Over-Current Protection

The modules include an internal output over-current protection circuit, which will endure current limiting for an unlimited duration during output overload. If the output current exceeds the OCP set point, the module will shut down, and always try to restart (hiccup mode) until the over current condition is corrected.

Over-Voltage Protection

The modules include an internal output over-voltage protection circuit, which monitors the voltage on the output terminals. If this voltage exceeds the over-voltage set point, the module will shut down, and always try to restart until the over voltage condition is corrected.

Over-Temperature Protection

The over-temperature protection consists of circuitry that provides protection from thermal damage. If the over-temperature is detected the module will shut down, and restart after the temperature is within specification.

Remote ON/OFF

The remote on/off feature on the module can be either negative or positive logic. Negative logic turns the module on during logic low and off during logic high. Positive logic turns the modules on during logic high and off during a logic low.

Remote on/off can be controlled by an external switch between the on/off terminal and the Vin (-) terminal. The switch can be an open collector or open drain. For negative logic if the remote on/off feature is not used, please short the on/off pin to Vin (-). For positive logic if the remote on/off feature is not used, please leave the on/off pin floating.

Figure 7: Remote ON/OFF Implementation

PULSE OUT

This pin outputs a 1 kHz 50% duty cycle pulse voltage with 12V amplitude. It is designed to provide a bootstrap signal for the input inrush current limit circuit, and also could indicate operating status with a LED connected. If you don't need it, please let it open.

Figure 8: An Active Circuit Design For Inrush Current Limit

UVLO

H80SV Series converters have an under voltage lockout feature that will shut down the converter if the input voltage falls below the adjustable threshold. Devices will automatically restart when input voltage rises above the UVLO threshold. The hysteresis built into this function prevents an indeterminate on/off condition at a single input voltage. The under voltage threshold is determined by the value of a resistor placed between the UVLO and VIN (-). Figure 9 shows a typical configuration.

Figure 9: Under voltage Lockout Configuration

The table below shows UVLO values for various nominal input voltages and the required resistor for each.

Nominal Vin	24V		36V	48V	72V	96V	110V
Turn-off Threshold	12.0±0.4V	14.0±0.4V	21.2 ±0.4V	28.4 ±0.4V	42.8 ±1V	57.2 ±1V	65.6 ±2V
Turn-on Threshold	14.0±0.4V	16.0±0.4V	24.5 ±0.4V	33.6 ±0.4V	50.4 ±1V	67.6 ±1V	76.8 ±2V
UVLO External Resistor (KΩ)*	2.2Meg (UVLO to Vin+)	open	24.9	12.4	6.19	4.12	3.48

Note: if need to configure UVLO turn off threshold to 12V, please make sure the output power is no more than 120w, even though the 12V operating is short duration. Otherwise the input current maybe over spec and cause some issue.

Hold up time

Hold up time is defined as the duration of time that the DC/DC converter output will remain active following a loss of input power. The BUS+ pin is for hold-up time function. It is designed to work with an external circuit comprises C4, R4, D1. When input power supply is interrupt, the H80 DCDC use the energy stored in C4 to support operation. A typical configuration shows as Figure 10.

R4: 100ohm,KNP100JT-73100R/YAGEO

D1: 200V/3A,

If hold-up time function is not needed, just leave the 3 components open.

Figure 10: Connection of External Hold-up Circuit

This function provides energy that maintains the DC-DC converter in operation for 10mS of hold up

time. The capacity in the application is recommended as below.

Vin Capacitance	24V	36V	48V	72V	96V	110V
For 10 mS	3600uF	3600uF	3600uF	3600uF	1000uF	600uF
For 30 mS	10800uF	10800uF	10800uF	10800uF	3000uF	1800uF

The voltage BUS+ varies with input voltage and the relationship is showed in figure11. The red curve, BUS(+) keeps stable at 80V(80V~90V) when input voltage rise from 16.8V to 75V, when the input voltage is above 75V, then BUS(+) follows input voltage. The blue one, BUS(+) falls with input voltage until the input voltage falls to 72V(72V~80V), then BUS(+) will maintain 80V until input voltage falls below the UVLO.

Figure 11: BUS(+) VS Input Voltage

Note: for the rated voltage of capacitor please refer to the BUS+ voltage curve showed in figure 11.

Output Voltage Adjustment (TRIM)

To increase or decrease the output voltage set point, connect an external resistor between the TRIM pin and SENSE (+) pin or SENSE (-) pin. The TRIM pin should be left open if this feature is not used.

For trim down, the external resistor value required to obtain a percentage of output voltage change Δ is defined as:

$$R_{trim-down} = \left[\frac{5.11}{\Delta} - 10.22 \right] (K\Omega)$$

Ex. When Trim-down -10% ($12V \times 0.9 = 10.8V$)

$$R_{trim-down} = \left[\frac{5.11}{10\%} - 10.22 \right] (K\Omega) = 40.88(K\Omega)$$

For trim up, the external resistor value required to obtain a percentage output voltage change Δ is defined as:

$$R_{trim-up} = \left[\frac{57.46}{\Delta} + 52.35 \right] K\Omega$$

Ex. When Trim-up +10% ($15 \times 110\% = 16.5V$)

$$R_{trim-up} = \left[\frac{57.46}{10\%} + 52.35 \right] = 626.95(K\Omega)$$

DESIGN CONSIDERATIONS

Input Source Impedance

C1:1UF MLCC or film cap, placed as close to module as possible

C2:100UF ALCAP

L1:3.3uH inductor, depress the ripple current flow into C2

For better EMC performance, it is recommended that C2 be parallel connected with MLCC 1UF like C3

Figure 12 input filter design

Bus Cap and Resistor

An electrolytic cap (C3) at least 200uF and a resistor (R3) 3ohm connected between bus+ and Vin- is necessary. The cap provides/absorb transient power and make the DCDC operating stable. The series resistor R3 is recommended to depress the high frequency ripple current flow into C3.

Figure 13 BUS pin circuit

Safety Considerations

The power module must be installed in compliance with the spacing and separation requirements of the end-user's safety agency standard, i.e., UL 60950-1, 2nd Edition, 2014-10-14, CSA C22.2 No. 60950-1-07, 2nd Edition, 2014-10, IEC 60950-1: 2005 + A1: 2009 + A2: 2013 and EN 60950-1: 2006 + A11: 2009 + A1: 2010 + A12: 2011 + A2: 2013, if the system in which the power module is to be used must meet safety agency requirements.

Reinforced insulation is provided between the input and output of the module. Input is considered as secondary hazardous voltage which main transient is up to 1500Vpk and output is considered as SELV circuit. The input source must be insulated from the ac mains by reinforced or double insulation. The input terminals of the module are not considered as operator accessible.

A SELV reliability test may require when install on the system where the module is used, in combination with the module, to ensure that under a single fault, hazardous voltage does not appear at the module's output.

Soldering and Cleaning Considerations

Post solder cleaning is usually the final board assembly process before the board or system undergoes electrical testing. Inadequate cleaning and/or drying may lower the reliability of a power module and severely affect the finished circuit board assembly test. Adequate cleaning and/or drying is especially important for un-encapsulated and/or open frame type power modules. For assistance on appropriate soldering and cleaning procedures, please contact Delta's technical support team.

THERMAL CONSIDERATIONS

The thermal curve is based on the test setup shown as figure13. The module is mounted on an Al plate and was cooled by cooling liquid.

Figure14 shows the location to monitor the temperature of the module's baseplate. The baseplate temperature in thermal curve is a reference for customer to make thermal evaluation and make sure the module is operated under allowable temperature. (Thermal curves shown in Figure15 are based on different input voltage).
