

SK6513 40V Low Quiescent Current, High Reliability LDO

GENERAL DESCRIPTION

The SK6513 series is a high accuracy, high input voltage low quiescent current, high speed, and low dropout liner regulator with high ripple rejection.

The SK6513 input voltage is up to 40V and load current is up to 300mA at $V_{OUT}=5V$ & $V_{IN}=7V$. The device is manufactured with BCD process.

The SK6513 offers over-current limit, soft start and over temperature protection to ensure the device working in well conditions.

The SK6513 regulators is available in standard SOT89-3L, SOT23-5L and SOT23-3L packages, and Standard products are Pb-free and Halogen-free.

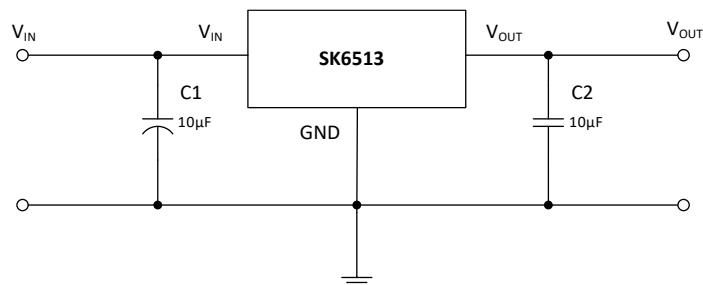

FEATURES

- Input voltage: 4.75V~40V
- Output voltage: 1.8V~5.7V
- Output accuracy: $\leq \pm 2\%$
- Output current: 150mA (Typ.)
Up to 300mA@ $V_{IN}=7V$, $V_{OUT}=5V$, SOT89-3
- PSRR: 60dB@100Hz
- Dropout voltage: 600mV@ $I_{OUT}=100mA$
- Quiescent current: 4.2μA@ $V_{IN}=12V$ (Typ.)
- ESD HBM: 8KV
- Recommend capacitor: 10μF

APPLICATIONS

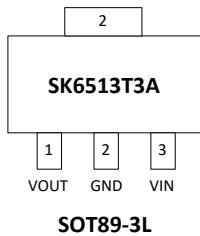

- Smart electric meter
- In-car entertainment
- Electric bicycle

TYPICAL APPLICATION CIRCUIT

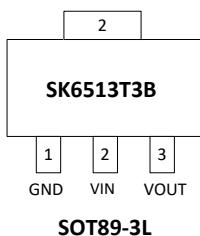

In plugging application, C1 is recommended to use 10μF electrolytic capacitor or 10μF MLCC with 2Ω series resistors to prevent chip burning due to the large input voltage spike when plugging. See APPLICATION INFORMATION for more information. C2 is recommend to use 10μF, and 1μF to 10μF can be used by customer according to special application.

APPLICATION INFORMATION

INPUT CAPACITOR

An input capacitor of $10\mu F$ is required between the VIN and GND pin. The capacitor shall be placed as close as possible to VIN pin, and the use of electrolytic capacitors is recommended. The tolerance and temperature coefficient must be considered in order to ensure the capacitor work within the operation range over the full range of temperature and operating conditions.

OUTPUT CAPACITOR

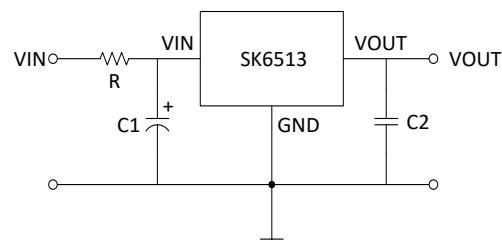

In applications, it is important to select the output capacitor for stable operation. The minimum capacitance for stable and correct operation is $1\mu F$. The capacitance tolerance should be $\pm 30\%$ or better over the operation temperature range. The recommended capacitor type is MLCC.

NO-LOAD STABILITY

The SK6513 will remain stable and in regulation with no external load. This is especially important in CMOS RAM keep-alive applications.

TYPICAL CIRCUIT

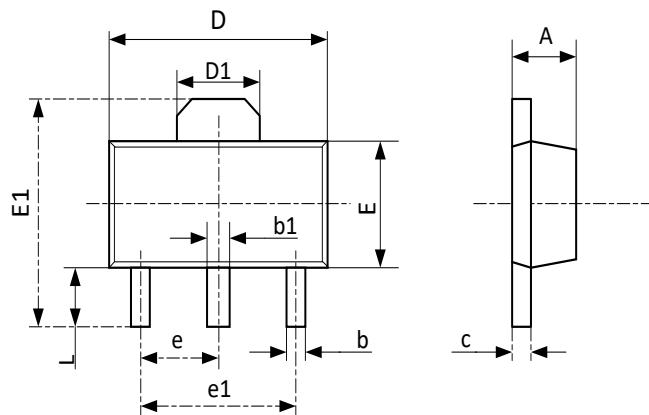

The following figure shows a typical application circuit for the SK6513 devices. The value of external components shall be chosen carefully, depending on the application. In plugging application, because the overshoot caused by the insertion and withdrawal of power on the chip may damage the chip, it is recommended that VIN be less than 30V and the input voltage spike should not exceed 45V.

In plugging application, it is suggested that R, C1 are selected as following:

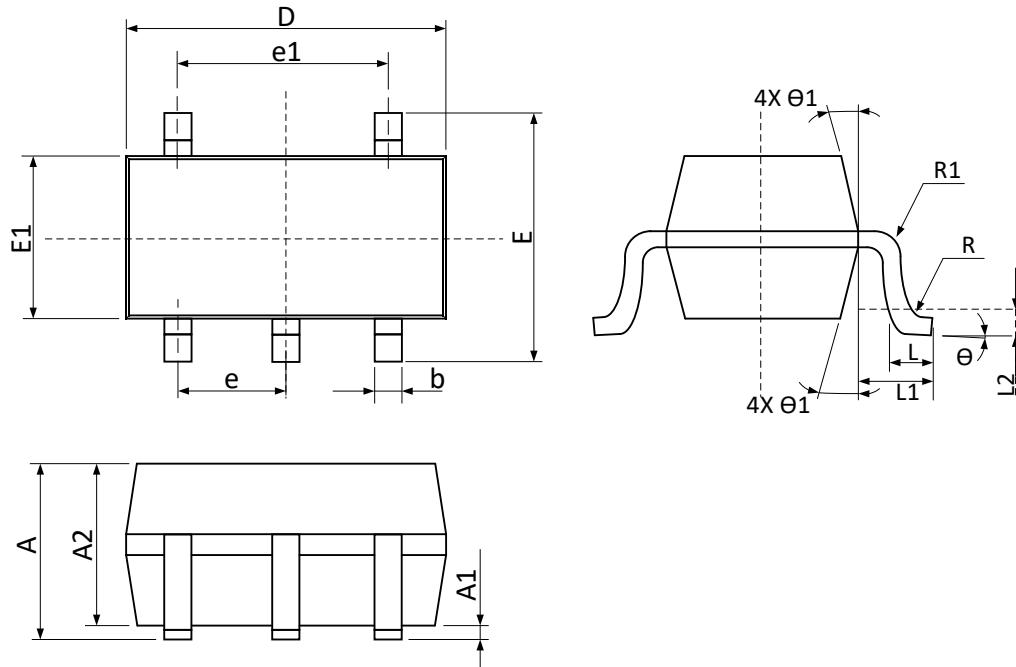

1. $C1=10\mu F$ to $100\mu F$ electrolytic capacitor with maximum voltage greater than 50V, $R=0$
2. $C1=1\mu F$ to $10\mu F$ MLCC with maximum voltage greater than 50V and $R=2\Omega$ in the type of 1206
– the resistor shall be carefully chosen to make sure enough margin to sustain the surge current during plugging.
