General Description

The HMC897 is a MMIC band pass filter which features a user selectable passband frequency. The 3 dB filter bandwidth is approximately 18%. The 20 dB filter bandwidth is approximately 35%. The center frequency can be varied between 9 and 19 GHz by applying an analog tune voltage between 0 and 14V. This tunable filter can be used as a much smaller alternative to physically large switched filter banks and cavity tuned filters. The HMC897 has excellent microphonics due to the monolithic design, and provides a dynamically adjustable solution in advanced communications applications.

Electrical Specifications, T_A = +25 °C

Pin Descriptions

Pin Number	Function	Description	Interface Schematic
Die Bottom	GND	Die bottom must be connected to RF/DC ground.	2	RFIN	This pad is AC coupled and matched to 50 Ohms.	5	RFOUT	This pad is AC coupled and matched to 50 Ohms.	7, 8, 9	Vfctl	Center frequency control voltage. All pads are interconnected on the die. Only one bond on any of these pads is required for center frequency control.	
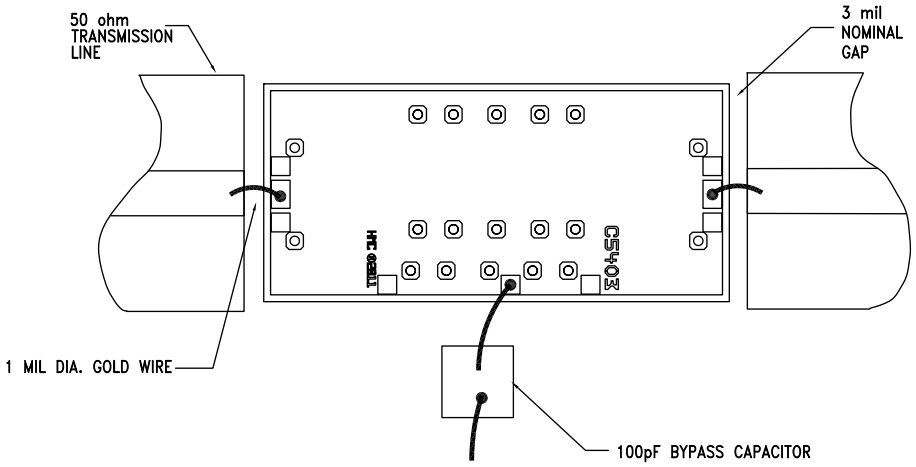
Assembly Diagram



NOTES:
1. The HMC899 I/O's are inherently capacitive in order to accommodate bond wire connections.
2. 1 mil diameter bond wires can be used.
3. Ideally, double bond wires 20 mils long, or a single bond wire 12 mils long should be used (approx.140 pH).
4. It is recommended that on the opposite side of the bond wires, an additional 20–50 fF fringe capacitance be present.
