

ADC322x

Dual-Channel, 12-Bit, 25-MSPS to 125-MSPS, Analog-to-Digital Converters

1 Features

- Dual channel
- 12-Bit resolution
- Single supply: 1.8 V
- Serial LVDS interface (SLVDS)
- Flexible input clock buffer with divide-by-1, -2, -4
- SNR = 70.2 dBFS, SFDR = 87 dBc at $f_{IN} = 70$ MHz
- Ultra-low power consumption:
 - 116 mW/Ch at 125 MSPS
- Channel isolation: 105 dB
- Internal dither and chopper
- Support for multi-chip synchronization
- Pin-to-pin compatible with 14-Bit version
- Package: VQFN-48 (7 mm × 7 mm)

2 Applications

- [Multi-carrier, multi-mode cellular base stations](#)
- [Radar and smart antenna arrays](#)
- [Munitions guidance](#)
- [Motor control feedback](#)
- [Network and vector analyzers](#)
- Communications test equipment
- Nondestructive testing
- [Microwave receivers](#)
- Software-defined radios (SDRs)
- Quadrature and diversity radio receivers
- [Handheld radio and instrumentation](#)

3 Description

The ADC322x are a high-linearity, ultra-low power, dual-channel, 12-bit, 25-MSPS to 125-MSPS, analog-to-digital converter (ADC) family. The devices are designed specifically to support demanding, high input frequency signals with large dynamic range requirements. An input clock divider allows more flexibility for system clock architecture design and the SYSREF input enables complete system synchronization. The ADC322x family supports serial low-voltage differential signaling (LVDS) in order to reduce the number of interface lines, thus allowing for high system integration density. The serial LVDS interface is two-wire, where each ADC data are serialized and output over two LVDS pairs. Optionally, a one-wire serial LVDS interface is available. An internal phase-locked loop (PLL) multiplies the incoming ADC sampling clock to derive the bit clock that is used to serialize the 12-bit output data from each channel. In addition to the serial data streams, the frame and bit clocks are also transmitted as LVDS outputs.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ADC322x	VQFN (48)	7.00 mm × 7.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

**Performance at $f_S = 125$ MSPS, $f_{IN} = 10$ MHz
(SNR = 70.6 dBFS, SFDR = 100 dBc)**

4 Revision History

Changes from Revision C (July 2019) to Revision D	Page
Deleted Graphs: Histogram, Integral Nonlinearity, and Differential Nonlinearity	22
Deleted Graphs: Histogram, Integral Nonlinearity, and Differential Nonlinearity	27
Deleted Graphs: Histogram, Integral Nonlinearity, and Differential Nonlinearity	32
Deleted Graphs: Histogram, Integral Nonlinearity, and Differential Nonlinearity	37

Changes from Revision B (March 2016) to Revision C	Page
Added text to the <i>Description</i> : Optionally, a one-wire serial LVDS interface is available.	1
Changed the description of pin AVDD, DVDD, GND, and PDN pins in the <i>Pin Functions</i> table	5
Changed the condition statement for <i>Electrical Characteristics: General</i>	7
Moved the location of <i>Electrical Characteristics: General</i>	7
Changed the parameter description of $E_{G(REF)}$ in <i>Electrical Characteristics: General</i>	7
Deleted $E_{G(CHAN)}$ from <i>Electrical Characteristics: General</i>	7
Changed the parameter description of $\alpha_{(EGCHAN)}$ in <i>Electrical Characteristics: General</i>	7
Changed the condition statement for <i>Electrical Characteristics: ADC3221, ADC3222</i>	8
Changed ADC clock frequency (ADC3241) From: MAX = 125 MSPS To: MAX = 25 MSPS in <i>Electrical Characteristics: ADC3221, ADC3222</i>	8
Changed ADC clock frequency (ADC3242) From: MAX = 125 MSPS To: MAX = 50 MSPS in <i>Electrical Characteristics: ADC3221, ADC3222</i>	8
Changed the condition statement for <i>Electrical Characteristics: ADC3223, ADC3224</i>	8

• Changed the condition statement for <i>Electrical Characteristics: ADC3221</i>	9
• Changed the condition statement for <i>Electrical Characteristics: ADC3222</i>	11
• Changed the condition statement for <i>Electrical Characteristics: ADC3223</i>	13
• Changed the condition statement for <i>Electrical Characteristics: ADC3224</i>	15
• Added Differential swing to <i>DIGITAL INPUTS (SYSREFP, SYSREFM)</i>	17
• Deleted V_{IH} and V_{IL} from <i>DIGITAL INPUTS (SYSREFP, SYSREFM)</i>	17
• added table note: SYSREF is internally biased to 0.9 V.to <i>Digital Characteristics</i>	17
• Added Graphs: Histogram, Integral Nonlinearity, and Differential Nonlinearity	22
• Added Graphs: Histogram, Integral Nonlinearity, and Differential Nonlinearity	27
• Added Graphs: Histogram, Integral Nonlinearity, and Differential Nonlinearity	32
• Added Graphs: Histogram, Integral Nonlinearity, and Differential Nonlinearity	37
• Changed the <i>Overview</i> section	43
• Added <i>Using the SYSREF Input</i> section	46
• Changed the <i>Register Initialization through SPI</i> section	53
• Changed the <i>Detailed Design Procedure</i> section	66

Changes from Revision A (March 2015) to Revision B

Page

• Added <i>Digital Inputs</i> section to Digital Characteristics table	17
• Updated Figure 19 , Figure 20 , Figure 23 , Figure 24 , Figure 25 and, Figure 26	22
• Updated Figure 50 , Figure 53 , Figure 54 , Figure 55 , and Figure 56	27
• Updated Figure 79 , Figure 80 , Figure 83 , Figure 84 , Figure 85 , and Figure 86	32
• Updated Figure 109 , Figure 110 , Figure 113 , Figure 114 , Figure 115 , and Figure 116	37
• Changed conditions of Figure 122 and Figure 124	39
• Changed Figure 129	41
• Changed <i>SNR and Clock Jitter</i> section: changed typical thermal noise value in description of and changed Figure 138 to reflect updated thermal noise value	46
• Changed Table 3	47
• Changed <i>Lane</i> to <i>Wire</i> in Figure 139	48
• Changed <i>Register Map Summary</i> table: changed <i>FLIP BITS</i> to <i>FLIP WIRE</i> in register 04h, changed bit 7 in register 70Ah, and added register 13h	54
• Changed <i>Summary of Special Mode Registers</i> section: changed title, moved section to correct location	55
• Changed <i>lane</i> to <i>wire</i> in register 03h description	55
• Changed register 04h: changed <i>FLIP BITS</i> to <i>FLIP WIRE</i> and changed description of bit 0	56
• Changed register 0Ah and 0Bh descriptions	58
• Added register 13h	59
• Changed register 70Ah to include the DIS CLK FILT register bit	64

Changes from Original (July 2014) to Revision A

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
AVDD	6, 7, 8, 9, 12, 17, 20, 25, 28, 29, 30	I	Analog 1.8-V power supply, decoupled with capacitors.
CLKM	18	I	Negative differential clock input for the ADC
CLKP	19	I	Positive differential clock input for the ADC
DA0M	48	O	Negative serial LVDS output for channel A0
DA0P	47	O	Positive serial LVDS output for channel A0
DA1M	46	O	Negative serial LVDS output for channel A1
DA1P	45	O	Positive serial LVDS output for channel A1
DB0M	40	O	Negative serial LVDS output for channel B0
DB0P	39	O	Positive serial LVDS output for channel B0
DB1M	38	O	Negative serial LVDS output for channel B1
DB1P	37	O	Positive serial LVDS output for channel B1
DCLKM	44	O	Negative bit clock output
DCLKP	43	O	Positive bit clock output
DVDD	2, 4, 33, 35	I	Digital 1.8-V power supply, decoupled with capacitors.
FCLKM	42	O	Negative frame clock output
FCLKP	41	O	Positive frame clock output
GND	1, 3, 5, 32, 34, 36	I	Ground, 0 V. Connect to the printed circuit board (PCB) ground plane. PowerPAD™
INAM	11	I	Negative differential analog input for channel A
INAP	10	I	Positive differential analog input for channel A
INBM	26	I	Negative differential analog input for channel B
INBP	27	I	Positive differential analog input for channel B
PDN	31	I	Power-down control; active high. This pin may be configured through the SPI. This pin has an internal 150-kΩ pull-down resistor.
RESET	21	I	Hardware reset; active high. This pin has an internal 150-kΩ pull-down resistor.
SCLK	13	I	Serial interface clock input. This pin has an internal 150-kΩ pull-down resistor.
SDATA	14	I	Serial interface data input. This pin has an internal 150-kΩ pull-down resistor.
SDOUT	16	O	Serial interface data output
SEN	15	I	Serial interface enable; active low. This pin has an internal 150-kΩ pull-up resistor to AVDD.
SYSREFM	23	I	Negative external SYSREF input
SYSREFP	22	I	Positive external SYSREF input
VCM	24	O	Common-mode voltage for analog inputs

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Analog supply voltage range, AVDD		−0.3	2.1	V
Digital supply voltage range, DVDD		−0.3	2.1	V
Voltage applied to input pins	INAP, INBP, INAM, INBM	−0.3	min (1.9, AVDD + 0.3)	V
	CLKP, CLKM	−0.3	AVDD + 0.3	
	SYSREFP, SYSREFM	−0.3	AVDD + 0.3	
	SCLK, SEN, SDATA, RESET, PDN	−0.3	3.9	
Temperature	Operating free-air, T _A	−40	85	°C
	Operating junction, T _J		125	
	Storage, T _{stg}	−65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
SUPPLIES						
AVDD	Analog supply voltage range		1.7	1.8	1.9	V
DVDD	Digital supply voltage range		1.7	1.8	1.9	V
ANALOG INPUT						
V _{ID}	Differential input voltage	For input frequencies < 450 MHz	2			V _{PP}
		For input frequencies < 600 MHz	1			
V _{IC}	Input common-mode voltage		VCM ± 0.025			V
CLOCK INPUT						
Input clock frequency		Sampling clock frequency	15 ⁽²⁾	125 ⁽³⁾		MSPS
Input clock amplitude (differential)	Sine wave, ac-coupled		0.2	1.5		V _{PP}
	LVPECL, ac-coupled		1.6			
	LVDS, ac-coupled		0.7			
Input clock duty cycle			35%	50%	65%	
Input clock common-mode voltage			0.95			V
DIGITAL OUTPUTS						
C _{LOAD}	Maximum external load capacitance from each output pin to GND		3.3			pF
R _{LOAD}	Differential load resistance placed externally		100			Ω

- (1) To reset the device for the first time after power-up, only use the RESET pin; see the [Register Initialization](#) section.
(2) See [Table 3](#) for details.
(3) With the clock divider enabled by default for divide-by-1. Maximum sampling clock frequency for the divide-by-4 option is 500 MSPS.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADC322x	UNIT
		RGZ (VQFN)	
		48 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	25.7	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	18.9	°C/W
R _{θJB}	Junction-to-board thermal resistance	3.0	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.2	°C/W
ψ _{JB}	Junction-to-board characterization parameter	3	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.5	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics: General

At maximum sampling rate, 50% clock duty cycle, AVDD = DVDD = 1.8 V, and –1-dBFS differential input. Typical values are specified at an ambient temperature of 25°C. Minimum and maximum values are specified over an ambient temperature range of –40°C to +85°C (unless otherwise noted).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
RESOLUTION					
Resolution		12			Bits
ANALOG INPUT					
Differential input full-scale			2.0		V _{PP}
R _{IN}	Input resistance	Differential at dc	6.6		kΩ
C _{IN}	Input capacitance	Differential at dc	3.7		pF
V _{OC(VCM)}	VCM common-mode voltage output		0.8	0.95	1.1
	VCM output current capability		10		mA
	Input common-mode current	Per analog input pin	1.5		μA/MSPS
	Analog input bandwidth (3 dB)	50-Ω differential source driving 50-Ω termination across INP and INM	540		MHz
DC ACCURACY					
E _O	Offset error		–25	25	mV
α _{EO}	Temperature coefficient of offset error		±0.024		mV/°C
E _{G(REF)}	E_G Overall dc gain error of a channel		–2%	2%	
α _(EGCHAN)	Temperature coefficient of overall gain error		±0.008		Δ%FS/°C
CHANNEL-TO-CHANNEL ISOLATION					
Crosstalk ⁽¹⁾	f _{IN} = 10 MHz		105		dB
	f _{IN} = 100 MHz		105		
	f _{IN} = 200 MHz		105		
	f _{IN} = 230 MHz		105		
	f _{IN} = 300 MHz		105		

(1) Crosstalk is measured with a –1-dBFS input signal on one channel and no input on the other channel.

7.6 Electrical Characteristics: ADC3221, ADC3222

At maximum sampling rate, 50% clock duty cycle, AVDD = DVDD = 1.8 V, and –1-dBFS differential input. Typical values are specified at an ambient temperature of 25°C. Minimum and maximum values are specified over an ambient temperature range of –40°C to +85°C (unless otherwise noted).

PARAMETER	ADC3241			ADC3242			UNIT
	MIN	TYP	MAX	MIN	TYP	MAX	
ADC clock frequency			25			50	MSPS
1.8-V analog supply current		31	71		39	81	mA
1.8-V digital supply current		35	65		43	75	mA
Total power dissipation		118	205		147	245	mW
Global power-down dissipation		5	17		5	17	mW
Standby power-down dissipation		78	103		78	103	mW

7.7 Electrical Characteristics: ADC3223, ADC3224

At maximum sampling rate, 50% clock duty cycle, AVDD = DVDD = 1.8 V, and –1-dBFS differential input. Typical values are specified at an ambient temperature of 25°C. Minimum and maximum values are specified over an ambient temperature range of –40°C to +85°C (unless otherwise noted).

PARAMETER	ADC3243			ADC3244			UNIT
	MIN	TYP	MAX	MIN	TYP	MAX	
ADC clock frequency			80			125	MSPS
1.8-V analog supply current		50	91		65	106	mA
1.8-V digital supply current		52	85		64	95	mA
Total power dissipation		183	285		233	325	mW
Global power-down dissipation		5	17		5	17	mW
Standby power-down dissipation		72	103		78	103	mW

7.8 AC Performance: ADC3221

At maximum sampling rate, 50% clock duty cycle, AVDD = DVDD = 1.8 V, and –1-dBFS differential input. Typical values are specified at an ambient temperature of 25°C. Minimum and maximum values are specified over an ambient temperature range of –40°C to +85°C (unless otherwise noted).

7.12 Digital Characteristics

the dc specifications refer to the condition where the digital outputs are not switching, but are permanently at a valid logic level 0 or 1; AVDD = DVDD = 1.8 V, and –1-dBFS differential input (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
DIGITAL INPUTS (RESET, SCLK, SDATA, SEN, PDN)							
V _{IH}	High-level input voltage		All digital inputs support 1.8-V and 3.3-V CMOS logic levels	1.3			V
V _{IL}	Low-level input voltage		All digital inputs support 1.8-V and 3.3-V CMOS logic levels			0.4	V
I _{IH}	High-level input current	RESET, SDATA, SCLK, PDN	V _{HIGH} = 1.8 V		10		μA
		SEN ⁽¹⁾	V _{HIGH} = 1.8 V		0		
I _{IL}	Low-level input current	RESET, SDATA, SCLK, PDN	V _{LOW} = 0 V		0		μA
		SEN	V _{LOW} = 0 V		10		
DIGITAL INPUTS (SYSREFP, SYSREFM)							
	Differential swing			0.2	0.8	1	V
	Common-mode voltage for SYSREF ⁽²⁾				0.9		V
DIGITAL OUTPUTS, CMOS INTERFACE (SDOUT)							
V _{OH}	High-level output voltage			DVDD – 0.1	DVDD		V
V _{OL}	Low-level output voltage				0	0.1	V
DIGITAL OUTPUTS, LVDS INTERFACE							
V _{ODH}	High-level output differential voltage		With an external 100-Ω termination	280	350	460	mV
V _{ODL}	Low-level output differential voltage		With an external 100-Ω termination	–460	–350	–280	mV
V _{OCM}	Output common-mode voltage				1.05		V

- (1) SEN has an internal 150-kΩ pull-up resistor to AVDD. SPI pins (SEN, SCLK, SDATA) can be driven by 1.8-V or 3.3-V CMOS buffers.
(2) SYSREF is internally biased to 0.9 V.

7.13 Timing Requirements: General

typical values are at T_A = 25°C, AVDD = DVDD = 1.8 V, and –1-dBFS differential input (unless otherwise noted); minimum and maximum values are across the full temperature range: T_{MIN} = –40°C to T_{MAX} = 85°C

			MIN	TYP	MAX	UNIT
t _A	Aperture delay		1.24	1.44	1.64	ns
	Aperture delay matching between two channels of the same device			±70		ps
	Aperture delay variation between two devices at same temperature and supply voltage			±150		ps
t _J	Aperture jitter			130		f _S rms
Wake-up time	Time to valid data after exiting standby power-down mode			35	65	μs
	Time to valid data after exiting global power-down mode (in this mode, both channels power down)			85	140	
ADC latency ⁽¹⁾	2-wire mode (default)			9		Clock cycles
	1-wire mode			8		
t _{SU_SYSREF}	SYSREF reference time	Setup time for SYSREF referenced to input clock rising edge	1000			ps
t _{H_SYSREF}		Hold time for SYSREF referenced to input clock rising edge	100			

- (1) Overall latency = ADC latency + t_{PDI} (see Figure 131)

7.14 Timing Requirements: LVDS Output

typical values are at $T_A = 25^\circ\text{C}$, $AVDD = DVDD = 1.8\text{ V}$, and -1-dBFS differential input, 6x serialization (2-wire mode), $C_{\text{LOAD}} = 3.3\text{ pF}^{(1)}$, and $R_{\text{LOAD}} = 100\ \Omega^{(2)}$ (unless otherwise noted); minimum and maximum values are across the full temperature range: $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 85^\circ\text{C}^{(3)(4)}$

		MIN	TYP	MAX	UNIT
t_{SU}	Data setup time: data valid to zero-crossing of differential output clock (CLKOUTP – CLKOUTM) ⁽⁵⁾	0.43	0.5		ns
t_{HO}	Data hold time: zero-crossing of differential output clock (CLKOUTP – CLKOUTM) to data becoming invalid ⁽⁵⁾	0.48	0.58		ns
t_{PDI}	Clock propagation delay: input clock falling edge cross-over to frame clock rising edge cross-over (15 MSPS < sampling frequency < 125 MSPS)	1-wire mode	2.7	4.5	6.5
		2-wire mode	$0.44 \times t_{\text{S}} + t_{\text{DELAY}}$		ns
t_{DELAY}	Delay time	3	4.5	5.9	ns
	LVDS bit clock duty cycle: duty cycle of differential clock (CLKOUTP – CLKOUTM)		49%		
$t_{\text{FALL}}, t_{\text{RISE}}$	Data fall time, data rise time: rise time measured from -100 mV to 100 mV , $15\text{ MSPS} \leq \text{Sampling frequency} \leq 125\text{ MSPS}$		0.11		ns
$t_{\text{CLKRISE}}, t_{\text{CLKFALL}}$	Output clock rise time, output clock fall time: rise time measured from -100 mV to 100 mV , $10\text{ MSPS} \leq \text{Sampling frequency} \leq 125\text{ MSPS}$		0.11		ns

- (1) C_{LOAD} is the effective external single-ended load capacitance between each output pin and ground.
- (2) R_{LOAD} is the differential load resistance between the LVDS output pair.
- (3) Measurements are done with a transmission line of a $100\text{-}\Omega$ characteristic impedance between the device and load. Setup and hold time specifications take into account the effect of jitter on the output data and clock.
- (4) Timing parameters are ensured by design and characterization and are not tested in production.
- (5) Data valid refers to a logic high of 100 mV and a logic low of -100 mV .

Table 1. LVDS Timing at Lower Sampling Frequencies: 6X Serialization (2-Wire Mode)

SAMPLING FREQUENCY (MSPS)	SETUP TIME (t_{SU} , ns)			HOLD TIME (t_{HO} , ns)		
	MIN	TYP	MAX	MIN	TYP	MAX

9 Detailed Description

9.1 Overview

The devices are designed specifically to support demanding, high input frequency signals with large dynamic range requirements. An input clock divider allows more flexibility for system clock architecture design while the SYSREF input enables complete system synchronization by resetting the clock divider. The ADC322x family supports serial LVDS interface in order to reduce the number of interface lines, thus allowing for high system integration density. The serial LVDS interface is two-wire, where each ADC data are serialized and output over two LVDS pairs. An internal phase-locked loop (PLL) multiplies the incoming ADC sampling clock to derive the bit clock that is used to serialize the 14-bit output data from each channel. In addition to the serial data streams, the frame and bit clocks are also transmitted as LVDS outputs.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Analog Inputs

The ADC322x analog signal inputs are designed to be driven differentially. Each input pin (INP, INM) must swing symmetrically between $(V_{CM} + 0.5\text{ V})$ and $(V_{CM} - 0.5\text{ V})$, resulting in a $2\text{-}V_{PP}$ (default) differential input swing. The input sampling circuit has a 3-dB bandwidth that extends up to 540 MHz (50- Ω source driving a 50- Ω termination between INP and INM).

9.3.2 Clock Input

The device clock inputs can be driven differentially (sine, LVPECL, or LVDS) or single-ended (LVCMOS), with little or no difference in performance between them. The common-mode voltage of the clock inputs is set to 0.95 V using internal 5-k Ω resistors. The self-bias clock inputs of the ADC322x can be driven by the transformer-coupled, sine-wave clock source or by the ac-coupled, LVPECL and LVDS clock sources, as shown in Figure 132, Figure 133, and Figure 134. See Figure 135 for details regarding the internal clock buffer.

R_T = termination resistor, if necessary.

Figure 132. Differential Sine-Wave Clock Driving Circuit

Figure 133. LVDS Clock Driving Circuit

Figure 134. LVPECL Clock Driving Circuit

NOTE: C_{EQ} is 1 pF to 3 pF and is the equivalent input capacitance of the clock buffer.

Figure 135. Internal Clock Buffer

A single-ended CMOS clock can be ac-coupled to the CLKP input, with CLKM connected to ground with a 0.1- μ F capacitor, as shown in Figure 136. However, for best performance the clock inputs must be driven differentially, thereby reducing susceptibility to common-mode noise. For high input frequency sampling, TI recommends using a clock source with very low jitter. Band-pass filtering of the clock source can help reduce the effects of jitter. There is no change in performance with a non-50% duty cycle clock input.

Figure 136. Single-Ended Clock Driving Circuit

9.3.2.1 Using the SYSREF Input

The ADC344x has a SYSREF input pin that can be used when the clock-divider feature is used. A logic low-to-high transition on the SYSREF pin aligns the falling edge of the divided clock with the next falling edge of the input clock, essentially resetting the phase of the divided clock, as shown in [Figure 137](#). When multiple ADC344x devices are onboard and the clock divider option is used, the phase of the divided clock among the devices may not be the same. The phase of the divided clock in each device can be synchronized to the common sampling clock by using the SYSREF pins. SYSREF can be applied as mono-shot or periodic waveform. When applied as periodic waveform, its period must be integer multiple of period of the divided clock. When not used, the SYSREFP and SYSREFM pins can be connected to AVDD and GND, respectively. Alternatively, the SYSREF buffer inside the device can be powered down using the PDN SYSREF register bit.

Figure 137. Using SYSREF for Synchronization

9.3.2.2 SNR and Clock Jitter

The signal-to-noise ratio of the ADC is limited by three different factors, as shown in [Equation 1](#). Quantization noise (typically 74 dB for a 12-bit ADC) and thermal noise limit SNR at low input frequencies, and clock jitter sets SNR for higher input frequencies.

$$\text{SNR}_{\text{ADC}}[\text{dBc}] = -20 \cdot \log \sqrt{\left(10^{\frac{\text{SNR}_{\text{Quantization_Noise}}}{20}}\right)^2 + \left(10^{\frac{\text{SNR}_{\text{Thermal_Noise}}}{20}}\right)^2 + \left(10^{\frac{\text{SNR}_{\text{Jitter}}}{20}}\right)^2} \quad (1)$$

The SNR limitation resulting from sample clock jitter can be calculated with [Equation 2](#).

$$\text{SNR}_{\text{Jitter}}[\text{dBc}] = -20 \cdot \log(2\pi \cdot f_{\text{in}} \cdot t_{\text{Jitter}}) \quad (2)$$

The total clock jitter (T_{Jitter}) has two components: the internal aperture jitter (130 fs for the device), which is set by the noise of the clock input buffer, and the external clock. T_{Jitter} can be calculated with [Equation 3](#).

$$t_{\text{Jitter}} = \sqrt{\left(t_{\text{Jitter,Ext.Clock_Input}}\right)^2 + \left(t_{\text{Aperture_ADC}}\right)^2} \quad (3)$$

External clock jitter can be minimized by using high-quality clock sources and jitter cleaners as well as band-pass filters at the clock input and a faster clock slew rate improves ADC aperture jitter. The devices have a typical thermal noise of 73.5 dBFS and an internal aperture jitter of 130 fs. The SNR, depending on the amount of external jitter for different input frequencies. [Figure 138](#) shows SNR (from 1 MHz offset leaving the 1/f flicker noise) for different jitter of clock driver.

Figure 138. SNR vs Frequency for Different Clock Jitter

9.3.3 Digital Output Interface

The devices offer two different output format options, thus making interfacing to a field-programmable gate array (FPGA) or an application-specific integrated circuit (ASIC) easy. Each option can be easily programmed using the serial interface, as shown in [Table 3](#). The output interface options are:

- One-wire, 1X frame clock, 12X serialization with the DDR bit clock and
- Two-wire, 1X frame clock, 6X serialization with the DDR bit clock.

Table 3. Interface Rates

INTERFACE OPTIONS	SERIALIZATION	MAXIMUM RECOMMENDED SAMPLING FREQUENCY (MSPS)		BIT CLOCK FREQUENCY (MHz)	FRAME CLOCK FREQUENCY (MHz)	SERIAL DATA RATE PER WIRE (Mbps)
		MIN	MAX			
One-wire	12X	15 ⁽¹⁾		90	15	180
			65	390	65	780
Two-wire	6X	20 ⁽¹⁾		60	20	120
			125	375	125	750

(1) Use the LOW SPEED ENABLE register bits for low speed operation; see [Table 22](#).

9.3.3.1 One-Wire Interface: 12X Serialization

In this interface option, the device outputs the data of each ADC serially on a single LVDS pair (one-wire). The data are available at the rising and falling edges of the bit clock (DDR bit clock). The ADC outputs a new word at the rising edge of every frame clock, starting with the MSB. The data rate is a 12X sample frequency (12X serialization).

9.3.3.2 Two-Wire Interface: 6X Serialization

The two-wire interface is recommended for sampling frequencies above 65 MSPS. The output data rate is a 6X sample frequency because six data bits are output every clock cycle on each differential pair. Each ADC sample is sent over the two wires with the six MSBs on Dx1P, Dx1M and the six LSBs on Dx0P, Dx0M, as shown in Figure 139.

Figure 139. Output Timing Diagram

9.4 Device Functional Modes

9.4.1 Input Clock Divider

The devices are equipped with an internal divider on the clock input. The clock divider allows operation with a faster input clock, thus simplifying the system clock distribution design. The clock divider can be bypassed for operation with a 125-MHz clock; the divide-by-2 option supports a maximum input clock of 250 MHz and the divide-by-4 option provides a maximum input clock frequency of 500 MHz.

9.4.2 Chopper Functionality

The devices are equipped with an internal chopper front-end. Enabling the chopper function swaps the ADC noise spectrum by shifting the $1/f$ noise from dc to $f_S / 2$. [Figure 140](#) shows the noise spectrum with the chopper off and [Figure 141](#) shows the noise spectrum with the chopper on. This function is especially useful in applications requiring good ac performance at low input frequencies or in dc-coupled applications. The chopper can be enabled via SPI register writes and is recommended for input frequencies below 30 MHz. The chopper function creates a spur at $f_S / 2$ that must be filtered out digitally.

Figure 140. Chopper Off

Figure 141. Chopper On

9.4.3 Power-Down Control

The power-down functions of the ADC322x can be controlled either through the parallel control pin (PDN) or through an SPI register setting (see [register 15h](#)). The PDN pin can also be configured via the SPI to a global power-down or standby functionality, as shown in [Table 4](#).

Table 4. Power-Down Modes

FUNCTION	POWER CONSUMPTION (mW)	WAKE-UP TIME (μ s)
Global power-down	5	85
Standby	81	35

9.4.3.1 Improving Wake-Up Time From Global Power-Down

The device has an internal low-pass filter in the sampling clock path. This low-pass filter helps improve the aperture jitter of the device. However, in applications where input frequencies are < 200 MHz, noise from the aperture jitter does not dominate the overall SNR of the device. In such applications, the wake-up time from a global power-down can be reduced by bypassing the low-pass filter using the DIS CLK FILT register bit (write 80h to register address 70Ah). As shown in Table 5, setting the DIS CLK FILT bit improves the wake-up time from a global power-down from 85 μ s to 55 μ s.

Table 5. Wake-Up Time From Global Power-Down

DIS CLK FILT REGISTER BIT	GLOBAL PDN REGISTER BIT	WAKE-UP TIME		
		TYP	MAX	UNIT
0	0→1→0	85	140	μ s
1	0→1→0	55	81	μ s

9.4.4 Internal Dither Algorithm

The ADC322x use an internal dither algorithm to achieve high SFDR and a clean spectrum. However, the dither algorithm marginally degrades SNR, creating a trade-off between SNR and SFDR. If desired, the dither algorithm can be turned off by using the DIS DITH CHx registers bits. Figure 142 and Figure 143 show the effect of using dither algorithms.

9.5 Programming

The ADC322x can be configured using a serial programming interface, as described in this section.

9.5.1 Serial Interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock), SDATA (serial interface data), and SDOUT (serial interface data output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data SDATA are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 20 MHz down to very low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

Programming (continued)

9.5.1.1 Register Initialization

After power-up, the internal registers **must be** initialized to their default values through a hardware reset by applying a high pulse on the RESET pin (of durations greater than 10 ns), as shown in Figure 144. If required, the serial interface registers can be cleared during operation either:

1. Through a hardware reset, or
2. By applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 06h) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

9.5.1.1.1 Serial Register Write

The device internal register can be programmed with these steps:

1. Drive the SEN pin low,
2. Set the R/W bit to 0 (bit A15 of the 16-bit address),
3. Set bit A14 in the address field to 1,
4. Initiate a serial interface cycle by specifying the address of the register (A13 to A0) whose content must be written, and
5. Write the 8-bit data that are latched in on the SCLK rising edge.

Figure 144 and Table 6 show the timing requirements for the serial register write operation.

Figure 144. Serial Register Write Timing Diagram

Table 6. Serial Interface Timing⁽¹⁾

		MIN	TYP	MAX	UNIT
f_{SCLK}	SCLK frequency (equal to $1 / t_{SCLK}$)	> dc		20	MHz
t_{LOADS}	SEN to SCLK setup time	25			ns
t_{LOADH}	SCLK to SEN hold time	25			ns
t_{DSU}	SDIO setup time	25			ns
t_{DH}	SDIO hold time	25			ns

(1) Typical values are at 25°C, full temperature range is from $T_{MIN} = -40^{\circ}\text{C}$ to $T_{MAX} = 85^{\circ}\text{C}$, and $AVDD = DVDD = 1.8\text{ V}$, unless otherwise noted.

9.5.1.1.2 Serial Register Readout

The device includes a mode where the contents of the internal registers can be read back using the SDOUT pin. This readback mode can be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

1. Drive the SEN pin low.
2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers.
3. Set bit A14 in the address field to 1.
4. Initiate a serial interface cycle specifying the address of the register (A[13:0]) whose content must be read.
5. The device outputs the contents (D[7:0]) of the selected register on the SDOUT pin.
6. The external controller can latch the contents at the SCLK rising edge.
7. To enable register writes, reset the R/W register bit to 0.

When READOUT is disabled, the SDOUT pin is in a high-impedance mode. If serial readout is not used, the SDOUT pin must float. [Figure 145](#) shows a timing diagram of the serial register read operation. Data appear on the SDOUT pin at the SCLK falling edge with an approximate delay (t_{SD_DELAY}) of 20 ns, as shown in [Figure 146](#).

Figure 145. Serial Register Read Timing Diagram

Figure 146. SDOUT Timing Diagram

9.5.2 Register Initialization through SPI

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin, as shown in Figure 147 and Table 7.

Figure 147. Initialization of Serial Registers after Power-Up

Table 7. Power-Up Timing

		MIN	TYP	MAX	UNIT
t ₁	Power-on delay from power up to active high RESET pulse	1			ms
t ₂	Reset pulse duration: active high RESET pulse duration	10			ns
t ₃	Register write delay from RESET disable to SEN active	100			ns

If required, the serial interface registers may be cleared during operation either:

1. Through hardware reset, or
2. By applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 06h) to high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

9.6.1 Summary of Special Mode Registers

Table 9 lists the location, value, and functions of special mode registers in the device.

Table 9. Special Modes Summary

MODE	REGISTER SETTINGS	DESCRIPTION
Special modes	Registers 439h (bit 3) and 539h (bit 3)	Always set these bits high for best performance
Disable dither	Registers 1h (bits 5-2), 434h (bits 5 and 3), and 534h (bits 5 and 3)	Disable dither to improve SNR
Disable chopper	Registers 422h (bit 1) and 522h (bit 1)	Disable chopper to shift 1/f noise floor at dc
High IF modes	Registers 41Dh (bit 1), 51Dh (bit 1), and 608h (bits 7-6)	Improves HD3 for IF > 100 MHz

9.6.2 Serial Register Description

9.6.2.1 Register 01h

Figure 148. Register 01h

0	PDN SYSREF	R/W	0h	If the SYSREF pins are not used in the system, the SYSREF buffer must be powered down by setting this bit. 0 = Normal operation 1 = Powers down the SYSREF buffer

10 Applications and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

Typical applications involving transformer-coupled circuits are discussed in this section. Transformers (such as ADT1-1WT or WBC1-1) can be used up to 250 MHz to achieve good phase and amplitude balances at the ADC inputs. When designing the dc-driving circuits, the ADC input impedance must be considered. Figure 173 and Figure 174 show the impedance ($Z_{in} = R_{in} \parallel C_{in}$) across the ADC input pins.

10.2 Typical Applications

10.2.1 Driving Circuit Design: Low Input Frequencies

Figure 175. Driving Circuit for Low Input Frequencies

10.2.1.1 Design Requirements

For optimum performance, the analog inputs must be driven differentially. An optional 5-Ω to 15-Ω resistor in series with each input pin can be kept to damp out ringing caused by package parasitic. The drive circuit may have to be designed to minimize the affect of kick-back noise generated by sampling switches opening and closing inside the ADC, as well as ensuring low insertion loss over the desired frequency range and matched impedance to the source.

10.2.1.2 Detailed Design Procedure

A typical application involving using two back-to-back coupled transformers is shown in [Figure 175](#). This circuit is optimized for low input frequencies. An external R-C-R filter using 50-Ω resistors and a 22-pF capacitor is used with the series inductor (39 nH); this combination helps absorb the sampling glitches.

To improve phase and amplitude balance of first transformer, the termination resistors can be split between two transformers. For example, 25-Ω to 25-Ω termination across the secondary winding of the second transformer can be changed to 50-Ω to 50-Ω termination and another 50-Ω to 50-Ω resistor can be placed inside the dashed box between the transformers in [Figure 175](#).

10.2.1.3 Application Curve

[Figure 176](#) shows the performance obtained by using the circuit shown in [Figure 175](#).

$f_S = 125$ MSPS, SNR = 70.6 dBFS, $f_{IN} = 10$ MHz, SFDR = 101.1 dBc

Figure 176. Performance FFT at 10 MHz (Low Input Frequency)

Typical Applications (continued)

10.2.2 Driving Circuit Design: Input Frequencies Between 100 MHz to 230 MHz

Figure 177. Driving Circuit for Mid-Range Input Frequencies ($100 \text{ MHz} < f_{\text{IN}} < 230 \text{ MHz}$)

10.2.2.1 Design Requirements

See the [Design Requirements](#) section for further details.

10.2.2.2 Detailed Design Procedure

When input frequencies are between 100 MHz to 230 MHz, an R-LC-R circuit can be used to optimize performance, as shown in [Figure 177](#).

10.2.2.3 Application Curve

[Figure 178](#) shows the performance obtained by using the circuit shown in [Figure 177](#).

$f_s = 125 \text{ MSPS}$, $\text{SNR} = 70 \text{ dBFS}$, $f_{\text{IN}} = 170 \text{ MHz}$, $\text{SFDR} = 93.6 \text{ dBc}$

Figure 178. Performance FFT at 170 MHz (Mid Input Frequency)

Typical Applications (continued)

10.2.3 Driving Circuit Design: Input Frequencies Greater than 230 MHz

Figure 179. Driving Circuit for High Input Frequencies ($f_{IN} > 230$ MHz)

10.2.3.1 Design Requirements

See the [Design Requirements](#) section for further details.

10.2.3.2 Detailed Design Procedure

For high input frequencies (> 230 MHz), using the R-C-R or R-LC-R circuit does not show significant improvement in performance. However, a series resistance of $10\ \Omega$ can be used as shown in [Figure 179](#).

10.2.3.3 Application Curve

[Figure 180](#) shows the performance obtained by using the circuit shown in [Figure 179](#).

$f_S = 125$ MSPS, SNR = 67.4 dBFS, $f_{IN} = 450$ MHz, SFDR = 75.5 dBc

Figure 180. Performance FFT at 450 MHz (High Input Frequency)

11 Power Supply Recommendations

The device requires a 1.8-V nominal supply for AVDD and DVDD. There are no specific sequence power-supply requirements during device power-up. AVDD and DVDD can power up in any order.

12 Layout

12.1 Layout Guidelines

The ADC322x EVM layout can be used as a reference layout to obtain the best performance. A layout diagram of the EVM top layer is provided in [Figure 181](#). Some important points to remember during laying out the board are:

1. Analog inputs are located on opposite sides of the device pin out to ensure minimum crosstalk on the package level. To minimize crosstalk onboard, the analog inputs must exit the pin out in opposite directions, as shown in the reference layout of [Figure 181](#) as much as possible.
2. In the device pin out, the sampling clock is located on a side perpendicular to the analog inputs in order to minimize coupling between them. This configuration is also maintained on the reference layout of [Figure 181](#) as much as possible.
3. Keep digital outputs away from analog inputs. When these digital outputs exit the pin out, the digital output traces must not be kept parallel to the analog input traces because this configuration can result in coupling from digital outputs to analog inputs and degrade performance. All digital output traces to the receiver (such as an FPGA or an ASIC) must be matched in length to avoid skew among outputs.
4. At each power-supply pin (AVDD and DVDD), a 0.1- μ F decoupling capacitor must be kept close to the device. A separate decoupling capacitor group consisting of a parallel combination of 10- μ F, 1- μ F, and 0.1- μ F capacitors can be kept close to the supply source.

12.2 Layout Example

13.2 Community Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

13.3 Trademarks

E2E is a trademark of Texas Instruments.

PowerPAD is a trademark of Texas Instruments, Inc.

All other trademarks are the property of their respective owners.

13.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

13.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale (www.ti.com/legal/termsofsale.html) or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.
