

# $\mu$ A7800-SERIES POSITIVE-VOLTAGE REGULATORS

SLVS056D – MAY 1976 – REVISED NOVEMBER 1998

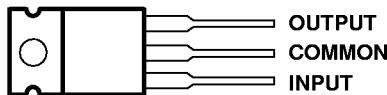

- 3-Terminal Regulators
- Output Current Up to 1.5 A
- Internal Thermal-Overload Protection
- High Power-Dissipation Capability
- Internal Short-Circuit Current Limiting
- Output Transistor Safe-Area Compensation
- Direct Replacements for Fairchild  $\mu$ A7800 Series

## description

This series of fixed-voltage monolithic integrated-circuit voltage regulators is designed for a wide range of applications. These applications include on-card regulation for elimination of noise and distribution problems associated with single-point regulation. Each of these regulators can deliver up to 1.5 A of output current. The internal current limiting and thermal shutdown features of these regulators essentially make them immune to overload. In addition to use as fixed-voltage regulators, these devices can be used with external components to obtain adjustable output voltages and currents and also can be used as the power-pass element in precision regulators.

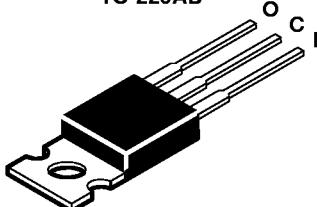

The  $\mu$ A7800C series is characterized for operation over the virtual junction temperature range of 0°C to 125°C. The  $\mu$ A7805Q and  $\mu$ A7812Q are characterized for operation over the virtual junction temperature range of -40°C to 125°C.

KC PACKAGE  
(TOP VIEW)

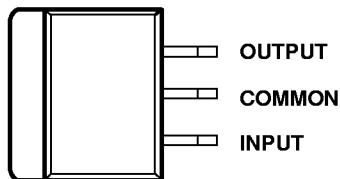

The common terminal is in electrical contact with the mounting base.

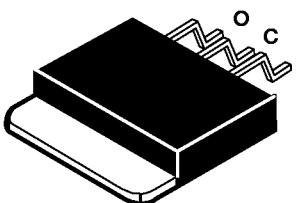

TO-220AB

KTE PACKAGE  
(TOP VIEW)

The common terminal is in electrical contact with the mounting base.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

### µA78xxY chip information

These chips, when properly assembled, have characteristics similar to the µA78xxC. Thermal compression or ultrasonic bonding can be used on the doped-aluminum bonding pads. The chips can be mounted with conductive epoxy or a gold-silicon preform.

# $\mu$ A7800-SERIES POSITIVE-VOLTAGE REGULATORS

SLVS056D – MAY 1976 – REVISED NOVEMBER 1998

## absolute maximum ratings over operating temperature ranges (unless otherwise noted)<sup>†</sup>

	$\mu$ A78xx	UNIT
Input voltage, $V_I$	$\mu$ A7824C	40
	All others	35
Continuous total power dissipation (see Note 1)	See Dissipation Rating Tables 1 and 2	
Virtual junction temperature range, $T_J$	$\mu$ A7800C series	0 to 150
	$\mu$ A7805Q, $\mu$ A7812Q	-40 to 150
Storage temperature range, $T_{STG}$	-65 to 150	
Lead temperature 1.6 mm (1/16 inch) from case for 10 seconds	260	

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: For operation above 25°C free-air or 90°C case temperature, refer to Figure 1 and Figure 2. To avoid exceeding the design maximum virtual junction temperature, these ratings should not be exceeded. Due to variations in individual device electrical characteristics and thermal resistance, the built-in thermal overload protection may be activated at power levels slightly above or below the rated dissipation.

DISSIPATION-RATING TABLE 1 — FREE-AIR TEMPERATURE

PACKAGE	$T_A \leq 25^\circ\text{C}$ POWER RATING	DERATING FACTOR ABOVE $T_A = 25^\circ\text{C}$	$T_A = 70^\circ\text{C}$ POWER RATING	$T_A = 105^\circ\text{C}$ POWER RATING	$T_A = 125^\circ\text{C}$ POWER RATING
KC	2000 mW	16.0 mW/°C	1280 mW	720 mW	400 mW
KTE	1900 mW	15.2 mW/°C	1216 mW	684 mW	380 mW

DISSIPATION-RATING TABLE 2 — CASE TEMPERATURE

PACKAGE	$T_C \leq 90^\circ\text{C}$ POWER RATING	DERATING FACTOR ABOVE $T_C = 90^\circ\text{C}$	$T_A = 125^\circ\text{C}$ POWER RATING
KC	15000 mW	250.0 mW/°C	6250 mW
KTE	14300 mW	238.0 mW/°C	5970 mW

# $\mu$ A7800-SERIES POSITIVE-VOLTAGE REGULATORS

SLVS056D – MAY 1976 – REVISED NOVEMBER 1998

## APPLICATION INFORMATION

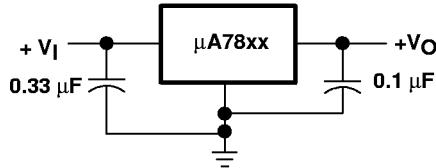

Figure 1. Fixed-Output Regulator

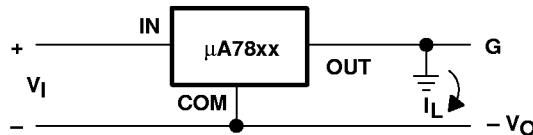

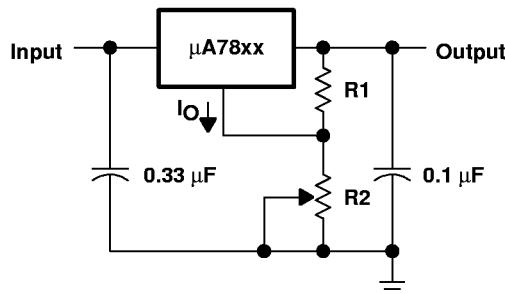

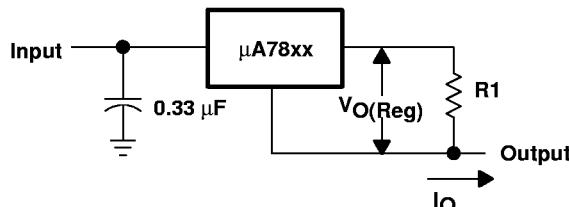

Figure 2. Positive Regulator in Negative Configuration ( $V_I$  Must Float)

NOTE A: The following formula is used when  $V_{XX}$  is the nominal output voltage (output to common) of the fixed regulator.

$$V_O = V_{XX} + \left( \frac{V_{XX}}{R_1} + I_Q \right) R_2$$

Figure 3. Adjustable-Output Regulator

$$I_O = (V_O/R_1) + I_O \text{ Bias Current}$$

Figure 4. Current Regulator

## APPLICATION INFORMATION

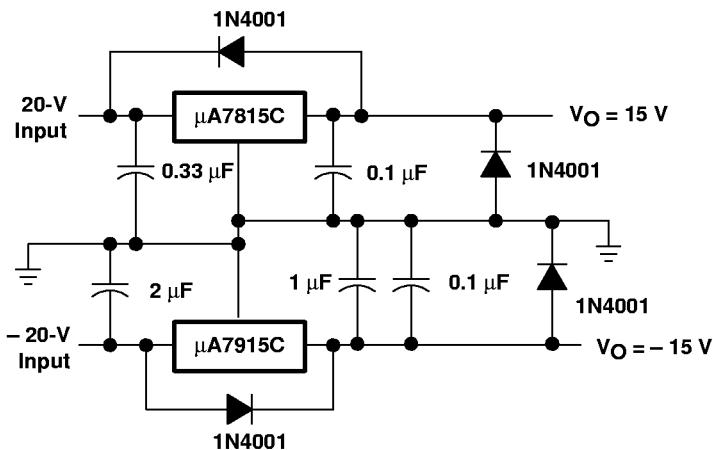

Figure 5. Regulated Dual Supply

### operation with a load common to a voltage of opposite polarity

In many cases, a regulator powers a load that is not connected to ground, but is connected to a voltage source of opposite polarity (e.g., op amps, level-shifting circuits, etc.). In these cases, a clamp diode should be connected to the regulator output as shown in Figure 6. This protects the regulator from output polarity reversals during start-up and short-circuit operation.

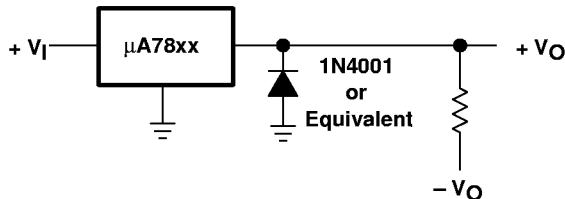

Figure 6. Output Polarity-Reversal Protection Circuit

### reverse-bias protection

Occasionally, the input voltage to the regulator can collapse faster than the output voltage. This can occur, for example, when the input supply is crowbarred during an output overvoltage condition. If the output voltage is greater than approximately 7 V, the emitter-base junction of the series pass element (internal or external) could break down and be damaged. To prevent this, a diode shunt can be used as shown in Figure 7.

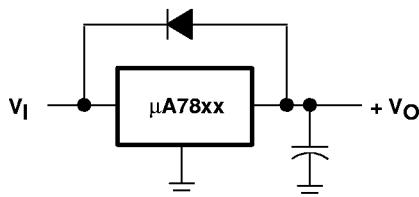

Figure 7. Reverse-Bias Protection Circuit
