P-Channel 150-V (D-S) MOSFET

PRODUCT SUMMARY

V_{DS} (V)	$R_{DS(on)}$ (Ω)	I_D (A)	Q_g (Typ.)
- 150	0.160 at $V_{GS} = -10$ V	- 2.8 ^c	23.2 nC
	0.200 at $V_{GS} = -4.5$ V	- 2.3 ^c	

SO-8

FEATURES

- Trench Power MOSFET
- 100% R_g and UIS Tested

APPLICATIONS

- Active Clamp in Intermediate DC/DC Power Supplies
- H-Bridge High Side Switch for Lighting Application

P-Channel MOSFET

b. Guaranteed by design, not subject to production testing.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

The graph shows the relationship between Source Current (I_S) and Source-to-Drain Voltage (V_{SD}) for the 2N3866 JFET. The y-axis is logarithmic, representing I_S in Amperes (A) from 0.1 to 100. The x-axis is linear, representing V_{SD} in Volts (V) from 0.0 to 1.5. Two curves are plotted for different temperatures: $T_J = 150\text{ }^{\circ}\text{C}$ and $T_J = 25\text{ }^{\circ}\text{C}$. The $150\text{ }^{\circ}\text{C}$ curve is shifted to the left of the $25\text{ }^{\circ}\text{C}$ curve, indicating higher current for the same voltage at higher temperature.

0.6	2.0	0.1
0.8	10.0	1.0
1.0	30.0	10.0

Figure 10 is a graph showing the On-Resistance ($R_{DS(on)}$) versus Gate-to-Source Voltage (V_{GS}) for the 2N7000 MOSFET. The Y-axis represents $R_{DS(on)}$ in Ohms (Ω), ranging from 0.0 to 2.0. The X-axis represents V_{GS} in Volts (V), ranging from 0 to 10. Two curves are plotted for different temperatures: $T_J = 125^\circ\text{C}$ (upper curve) and $T_J = 25^\circ\text{C}$ (lower curve). Both curves show a sharp drop in resistance around $V_{GS} = 4.5\text{V}$, followed by a plateau. The resistance is higher at 125°C than at 25°C .

A graph showing the variation of $V_{GS(th)}$ (Y-axis, ranging from -0.5 V to 1.0 V) versus T_J - Temperature ($^{\circ}C$) (X-axis, ranging from -50 to 150). Two curves are plotted, representing different drain currents I_D :

- $I_D = 250 \mu A$ (Dark line)
- $I_D = 5 mA$ (Light line)

Both curves show a positive linear relationship between $V_{GS(th)}$ and temperature. The $I_D = 250 \mu A$ curve is steeper than the $I_D = 5 mA$ curve.

Figure 1 is a line graph showing the power spectrum of the signal. The y-axis is labeled 'Power (W)' and ranges from 0 to 200 in increments of 40. The x-axis is labeled 'Time (s)' and is on a logarithmic scale with major ticks at 0.001, 0.01, 0.1, 1, and 10. The curve starts at approximately 200 W at 0.003 s and decays rapidly, reaching about 10 W at 10 s.

Figure 10 is a log-log plot showing the power dissipation characteristics of the MOSFET. The y-axis represents the Drain Current (I_D) in Amperes (A), ranging from 0.01 to 100. The x-axis represents the Drain-to-Source Voltage (V_{DS}) in Volts (V), ranging from 0.01 to 1000. The plot includes a solid line for DC power dissipation and several dashed lines for pulsed power dissipation at different pulse widths: 1 ms, 10 ms, 100 ms, 1 s, and 10 s. The DC power dissipation is limited by $R_{DS(on)}$ for $V_{DS} < 10$ V and by thermal limits for $V_{DS} > 10$ V. The pulsed power dissipation limits increase as the pulse width decreases, reaching up to 100 W for 1 ms pulses. The ambient temperature is specified as $T_A = 25$ °C.

* The power dissipation P_D is based on $T_{J(max.)} = 150$ °C, using junction-to-case thermal resistance, and is more useful in settling the upper dissipation limit for cases where additional heatsinking is used. It is used to determine the current rating, when this rating falls below the package limit.
