

Features

- Wide Operation Voltage Range of 1V to 7V
- Correct Logic Output Guaranteed to $V_{CC}=1.0V$
- 200ms Reset Pulse Width
- Independent Watchdog Timer-1.6s Timeout
- Power-Supply Transient Immunity
- 4 μA Supply Current

Applications

- Computers
- Embedded Systems
- Industrial Equipments
- Intelligent Instruments

Pin Definition

General Description

The series are cost effective system power supply supervisory circuits designed to monitor the power supplies in digital systems. This family provides circuit initialization and timing supervision. Independent watchdog monitoring circuitry and manual reset input are included. They significantly improve system reliability and accuracy compared to separate ICs or discrete components.

RESET VOLTAGE:

L=4.63V
M=4.38V
J=4.00V
T=3.08V
S=2.93V
R=2.63V
Z=2.32V
Y=2.19V

PIN CONFIGURATION

PIN	NAME	FUNCTION
1	$\overline{\text{RESET}}$	Active-Low Reset Output. Pulses low for 200ms when triggered, and remains low whenever VCC is below the reset threshold or when $\overline{\text{MR}}$ is a logic low. It remains low for 200ms after one of the following occurs: VCC rises above the reset threshold, the watchdog triggers a reset, or $\overline{\text{MR}}$ goes low to high.
2	GND	Ground
3	$\overline{\text{MR}}$	Manual-Reset Input triggers a reset pulse when pulled below 0.3VCC. The active-low input has an internal 52k Ω pull-up resistor. It can be driven from a TTL or CMOS logic line as well as shorted to ground with a switch. Leave open or connect to VCC if unused.
4	WDI	Watchdog Input. If WDI remains either high or low for longer than the watchdog timeout period, the internal watchdog timer runs out and a reset is triggered. The internal watchdog timer clears whenever reset is asserted, or whenever WDI sees a rising or falling edge. If WDI is left unconnected or is connected to a three-stated buffer output, the watchdog feature is disabled.
5	VCC	Supply Voltage

Note 1: Stresses beyond those listed under “Absolute maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
