

Octal D-Type Flip-Flop with 3-State Output

MC74VHC374, MC74VHCT374A

The MC74VHC374/MC74VHCT374A is an advanced high speed CMOS octal flip-flop with 3-state output fabricated with silicon gate CMOS technology. The device achieves high speed operation similar to equivalent Bipolar Schottky TTL while maintaining CMOS low power dissipation.

The 8-bit D-type flip-flop is controlled by a clock input and an output enable input. When the output enable input is high, the eight outputs are in a high impedance state.

The MC74VHC374 inputs are compatible with standard CMOS levels while the MC74VHCT374A inputs are compatible with TTL levels. The MC74VHCT374A can be used as a level converter for interfacing 3.3 V to 5.0 V, because it has full 5.0 V CMOS level output swings.

The internal circuit is composed of three stages, including a buffer output which provides high noise immunity and stable output. The MC74VHC374 and MC74VHCT374A input structures tolerate voltages up to 5.5 V, allowing the interface of 5 V systems to 3 V systems.

The MC74VHCT374A output structures provide protection when $V_{CC} = 0$ V. These output structures help prevent device destruction caused by supply voltage – input/output voltage mismatch, battery backup, hot insertion, etc.
