

1MHz 18V 3.0A Synchronous COT Step-Down Converter

Features

- 70mΩ/35mΩ Low $R_{DS(ON)}$ internal FETs
- High Efficiency Synchronous-Mode Operation
- Wide Input Range: 4.5V to 18V
- Output Voltage from 0.6V
- 1MHz Switch Frequency
- Up to 3.0A Output Current@1.2V_{OUT}
- COT control to achieve fast transient responses
- Power Save Mode at Light Load
- Integrated internal compensation
- Stable with Low ESR Ceramic Output Capacitors
- Over Current Protection with Hiccup Mode
- Thermal Shutdown
- Inrush Current Limit and Soft Start
- Built-in Input Over Voltage Protection
- Available in TSOT23-6 Package

Description

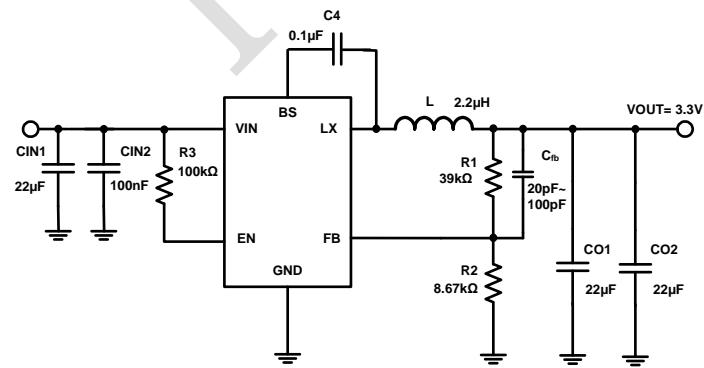

The TMI3253SH is a high efficiency 1MHz, Constant-on-Time (COT) control mode synchronous step-down DC-DC converter capable of delivering up to 3.0A current with 1.2V output voltage. TMI3253SH integrates main switch and synchronous switch with very low $R_{DS(ON)}$ to minimize the conduction loss. Low output voltage ripple and small external inductor and capacitor size are achieved with 1MHz switching frequency. It adopts the COT architecture to achieve fast transient responses for high voltage step down applications.

The TMI3253SH requires a minimum number of readily available standard external components and is available in a 6-pin TSOT23-6 ROHS compliant package.

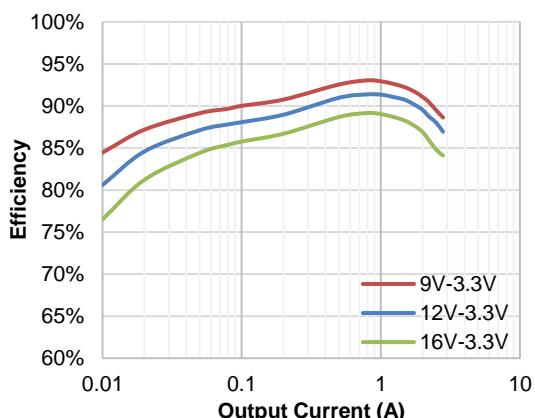

Application

- Digital Set Top Boxes
- Flat Panel Television and Monitors
- Notebook computer
- Wireless and DSL Modems

Typical Application

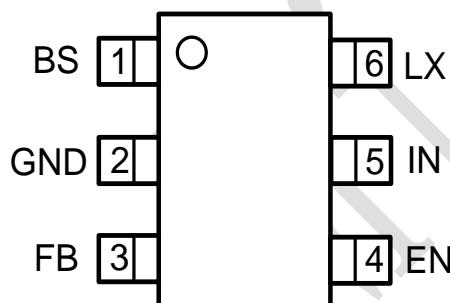

Efficiency
 $V_{OUT}=3.3V$, $T_A=25^\circ C$

Absolute Maximum Ratings (Note 1)

Parameter	Min	Max	Unit
Input Supply Voltage, EN	-0.3	20	V
LX Voltages	-0.3	20	V
FB Voltage	-0.3	6	V
BS Voltage	-0.3	23	V
Storage Temperature Range	-65	150	°C
Junction Temperature (Note2)	160		°C
Power Dissipation	1000		mW
Lead Temperature (Soldering, 10s)	260		°C

Package

TSOT23-6

Top Marking: TS5XXX

TS5: Device Code

XXX: Inside Code

Order Information

Part Number	Package	Top Marking	Quantity/Reel
TMI3253SH	TSOT23-6	TS5XXX	3000

TMI3253SH devices are Pb-free and RoHS compliant.

Pin Functions

Pin	Name	Function
2	GND	Ground Pin
6	LX	Switching Pin
5	IN	Power supply Pin
3	FB	Output Voltage feedback input. Connect FB to the center point of the external resistor divider.
4	EN	Drive this pin to a logic-high to enable the IC. Drive to a logic-low to disable the IC and enter micro-power shutdown mode. Don't floating EN.
1	BS	Bootstrap. A capacitor connected between LX and BST pins is required to form a floating supply across the high-side switch driver.

ESD Rating

Items	Description	Value	Unit
ESD	Human Body Model for all pins	±2000	V

JEDEC specification JS-001

Recommended Operating Conditions

Items	Description	Min	Max	Unit
Voltage Range	IN	4.5	18	V
T _J	Operating Junction Temperature	-40	125	°C

Thermal Resistance (Note3)

Items	Description	Value	Unit
θ _{JA}	Junction-to-ambient thermal resistance	100	°C/W

Electrical Characteristics

$V_{IN}=12V$, $V_{OUT}=3.3V$, $T_A = 25^\circ C$, unless otherwise noted.

Parameter	Conditions	Min	Typ	Max	Unit
Input Voltage Range		4.5		18	V
OVP Threshold			19.3		V
UVLO Rising Threshold		4.0			V
UVLO Hysteresis			0.45		V
Quiescent Current	$V_{EN}=2V$, $V_{FB}=V_{REF} \times 105\%$		300		μA
Shutdown Current	$V_{IN}=12V$, $EN=0V$		5	10	μA
Regulated Feedback Voltage	$T_A=25^\circ C$, $4.5V \leq V_{IN} \leq 18V$	0.588	0.6	0.612	V
High-Side Switch On-Resistance			70		$m\Omega$
Low-Side Switch On-Resistance			35		$m\Omega$
High-Side Switch Leakage Current	$V_{EN}=0V$, $V_{LX}=0V$	1		10	μA
Switch Valley Current Limit	Minimum Duty Cycle		4		A
On Time	$V_{IN}=12V$, $V_{OUT}=1.2V$, $I_{OUT}=1A$	90	120	160	ns
Oscillation Frequency			1000		kHz
Maximum Duty Cycle			65		%
Minimum On-Time			80		ns
Soft Start Time			1		ms
Hiccup on Time			1.4		ms
Hiccup Time Before Restart			4		ms
EN High-Level Input Voltage		1.5			V
EN Low-Level Input Voltage				0.3	V
Thermal Shutdown Threshold (Note 4)			165		$^\circ C$
Thermal Shutdown Hysteresis (Note 4)			30		$^\circ C$

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: T_J is calculated from the ambient temperature T_A and power dissipation P_D according to the following formula: $T_J = T_A + P_D \times \theta_{JA}$. The maximum allowable continuous power dissipation at any ambient temperature is calculated by $P_D(\text{MAX}) = (T_{J(\text{MAX})}-T_A)/\theta_{JA}$.

Note 3: Measured on JESD51-7, 4-layer PCB.

Note 4: Thermal shutdown threshold and hysteresis are guaranteed by design.

Operation Description

Internal Regulator

The TMI3253SH is a constant on-time (COT) step down DC/DC converter that provides excellent transient response with no extra external compensation components. This device contains low resistance, high voltage high side and low side power MOSFETs, and operates at 1MHz operating frequency to ensure a compact, high efficiency design with excellent AC and DC performance.

Error Amplifier

TMI3253SH adopts operational transconductance amplifier (OTA) as error amplifier. The error amplifier compares the FB pin voltage with the internal FB reference (V_{REF}) and outputs a current proportional to the difference between the two. This output current is then used to charge or discharge the internal compensation network to form the V_{COMP} voltage, which is used to compare with the low side power MOSFET current sensing signal and trigger on time pulse. The optimized internal compensation network minimizes the external component counts and simplifies the control loop design.

Internal Soft-Start

The soft-start is implemented to prevent the converter output voltage from overshooting during startup. When the chip starts, the internal circuitry generates a soft-start voltage (SS) ramping up from 0V to 0.6V. When it is lower than the internal FB reference (V_{REF}), SS overrides REF so the error amplifier uses SS as the reference. When SS is higher than V_{REF} , V_{REF} regains control. The SS time is internally fixed to 1ms typically.

Over-Current-Protection and Short Circuits Protection

The TMI3253SH has cycle-by-cycle valley current limit function. When the inductor current valley value is larger than the valley current limit during low side MOSFET on state, the device enters into valley over current protection mode and low side MOSFET keeps on state until inductor current drops down to the value equal or lower than the valley current limit, and then on time pulse could be generated and high side MOSFET could turn on again.

If the output is short to GND and the output voltage drop until feedback voltage V_{FB} is below the output under-voltage V_{UV} threshold which is typically 45% of V_{REF} , TMI3253SH enters into hiccup mode to periodically disable and restart switching operation. The hiccup mode helps to reduce power dissipation and thermal rise during output short condition. The period of TMI3253SH hiccup mode is typically 5.4ms.

Startup and Shutdown

If both VIN and EN are higher than their appropriate thresholds, the chip starts switching operation. The reference block starts first, generating stable reference voltage and currents, and then the internal regulator is enabled. The regulator provides stable supply for the remaining circuitries. Three events can shut down the chip: EN low, VIN low and thermal shutdown. In the shutdown procedure, the signaling path is first blocked to avoid any fault triggering. The V_{COMP} voltage and the internal supply rail are then pulled down. The floating driver is not subject to this shutdown command.

Application Information

Setting the Output Voltage

The external resistor divider is used to set the output voltage (see Typical Application on page 1). Choose R1 to be around 39k Ω for optimal transient response. R2 is then given by:

Table 1: Selection for Common Output Voltages ($V_{FB}=0.6V$)

V_{OUT} (V)	R1 (k Ω)	R2 (k Ω)	C_{FB} (pF)	L (μ H)
5	39	5.32	33	2.2
3.3	39	8.67	33	2.2
2.5	39	12.31	33	2.2
1.8	39	19.5	33	1.5
1.5	39	26	33	1.5
1.2	39	39	33	1.5
1	39	58.5	33	1.0

$$R_2 = \frac{R_1}{V_{out}/V_{FB} - 1}$$

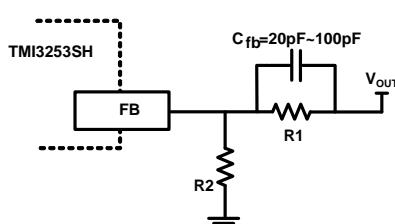

Figure 2. Feedback Network

Selecting the Inductor

A $1.0\mu\text{H}$ to $2.2\mu\text{H}$ inductor with a DC current rating of at least 25% percent higher than the maximum load current is recommended for most applications. For highest efficiency, the inductor DC resistance should be as small as possible. For most designs, the inductance value can be derived from the following equation.

$$L = \frac{V_{out} \times (V_{in} - V_{out})}{V_{in} \times \Delta I_L \times f_{osc}}$$

Where ΔI_L is the inductor ripple current. Choose inductor ripple current to be approximately 30% if the maximum load current, 3A. The maximum inductor peak current is:

$$I_{L(MAX)} = I_{LOAD} + \frac{\Delta I_L}{2}$$

Under light load conditions below 100mA, larger inductance is recommended for improved efficiency.

Selecting the Output Capacitor

The output capacitor (Co1 and Co2) is required to maintain the DC output voltage. Ceramic, tantalum, or low ESR electrolytic capacitors are recommended. Low ESR capacitors are preferred to keep the output voltage ripple low. The output voltage ripple can be estimated by:

$$\Delta V_{OUT} = \frac{V_{OUT}}{f_s \times L} \times \left[1 - \frac{V_{OUT}}{V_{IN}} \right] \times \left[R_{ESR} + \frac{1}{8 \times f_s \times C_2} \right]$$

Where L is the inductor value and R_{ESR} is the equivalent series resistance (ESR) value of the output capacitor. In the case of ceramic capacitors, the impedance at the switching frequency is dominated by the capacitance. The output voltage ripple is mainly caused by the capacitance. For simplification, the output voltage ripple can be estimated by:

$$\Delta V_{OUT} = \frac{V_{OUT}}{8 \times f_s^2 \times L \times C_2} \times \left[1 - \frac{V_{OUT}}{V_{IN}} \right]$$

In the case of tantalum or electrolytic capacitors, the ESR dominates the impedance at the switching frequency. For simplification, the output ripple can be approximated to:

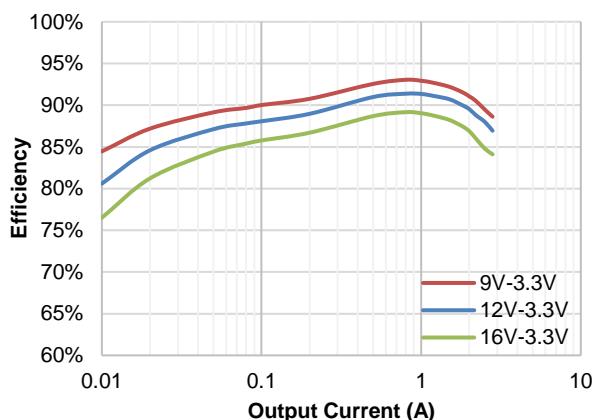

$$\Delta V_{OUT} = \frac{V_{OUT}}{f_s \times L} \times \left[1 - \frac{V_{OUT}}{V_{IN}} \right] \times R_{ESR}$$

The characteristics of the output capacitor also affect the stability of the regulation system. The TMI3253SH can be optimized for a wide range of capacitance and ESR values.

Typical Performance Characteristics

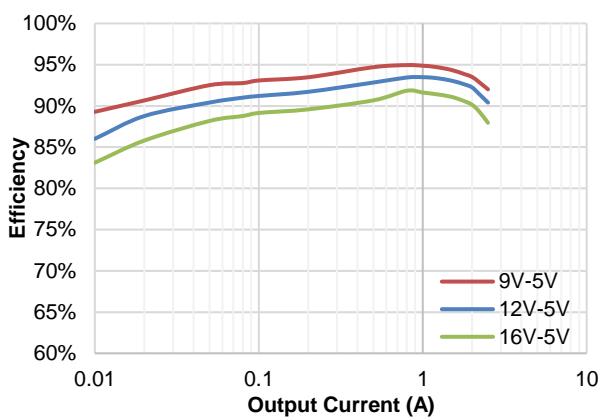

Efficiency

$V_{OUT} = 3.3V$, $L = 2.2\mu H$, $DCR = 20m\Omega$

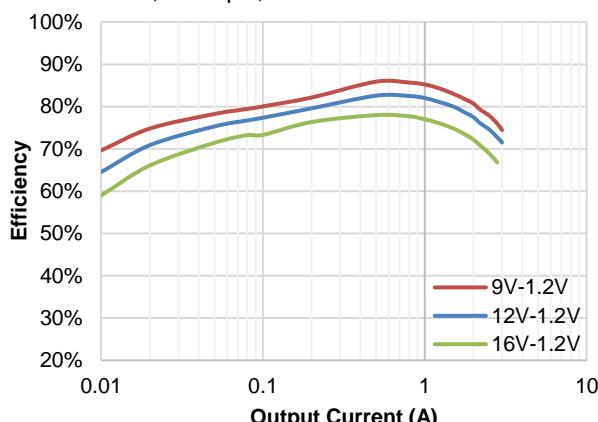

Efficiency

$V_{OUT} = 5V$, $L = 2.2\mu H$, $DCR = 30m\Omega$

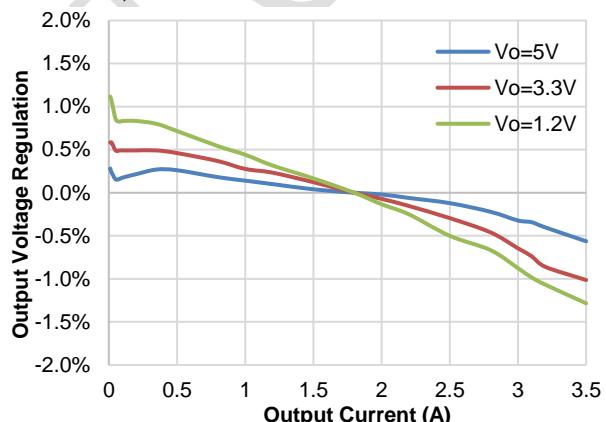

Efficiency

$V_{OUT} = 1.2V$, $L = 1.5\mu H$, $DCR = 20m\Omega$

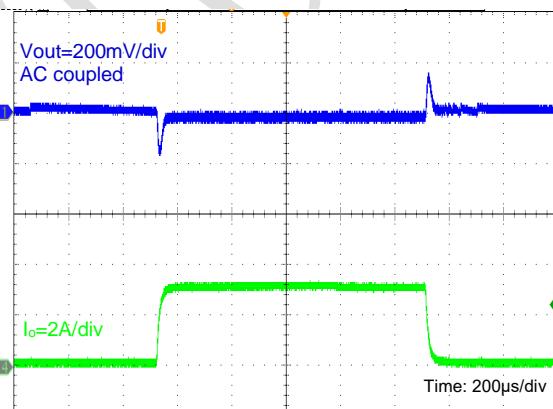

Load Regulation

$V_{IN} = 12V$, $T_A = 25^\circ C$

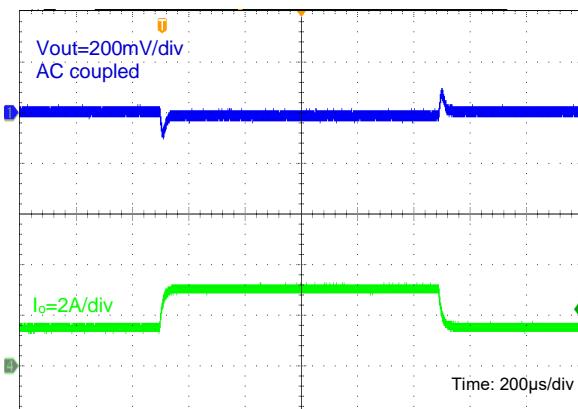

Load Transient

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, $I_o = 0A$ to $3A$

Load Transient

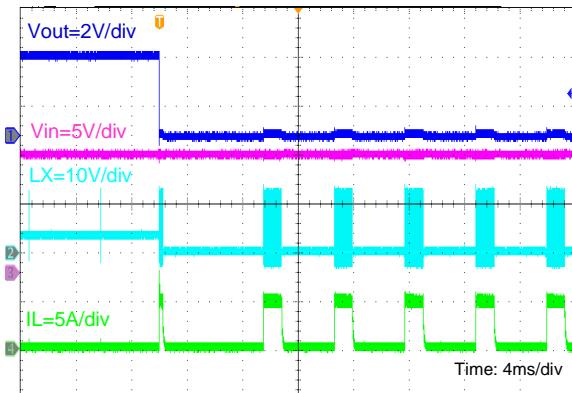

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, $I_o = 1.5A$ to $3A$

Typical Performance Characteristics(continued)

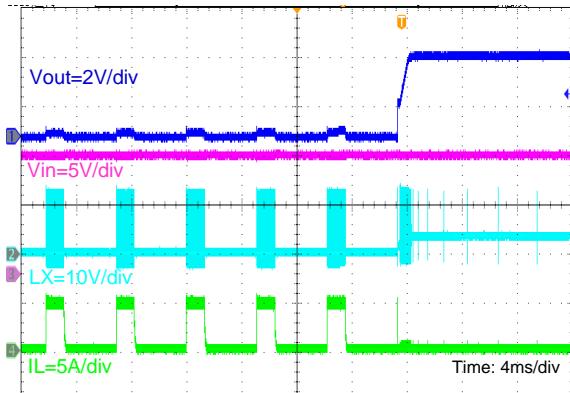

Output Short Entry

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, No Load

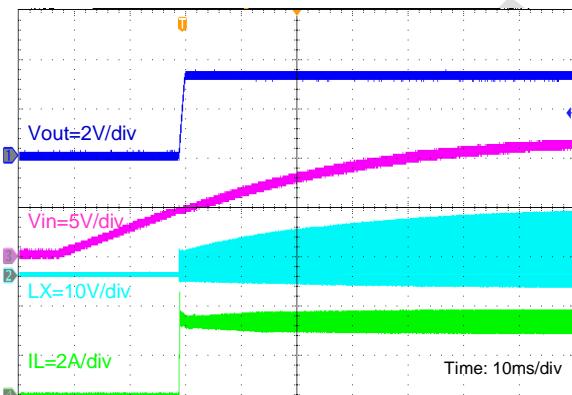

Output Short Recovery

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, No Load

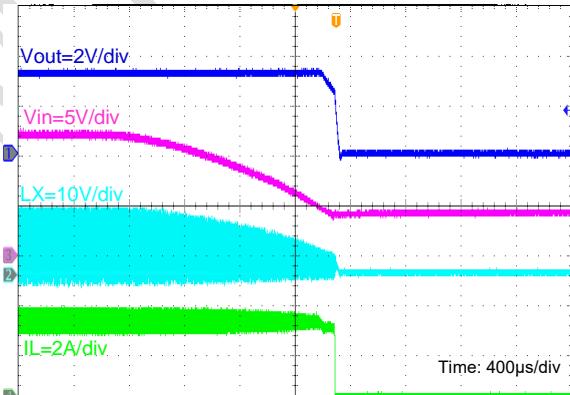

Input Power On

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, I_o =Full Load

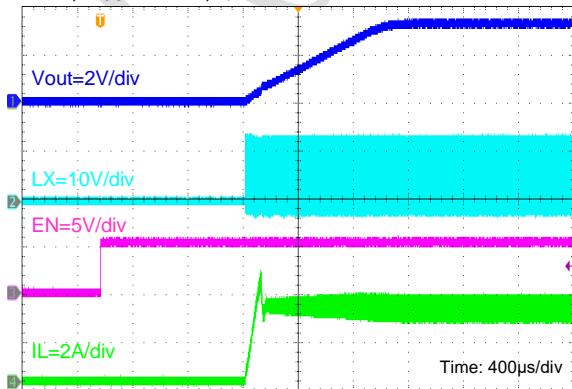

Input Power Down

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, I_o =Full Load

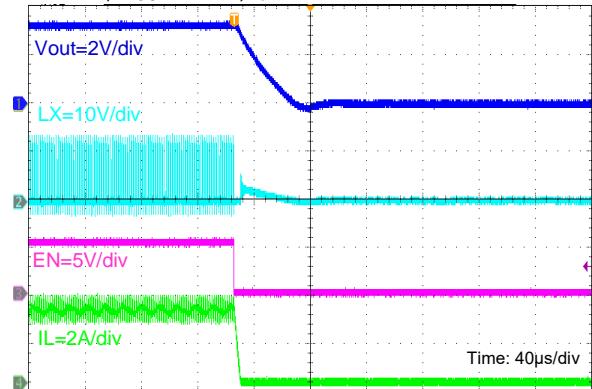

EN Enable

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, I_o =Full Load

EN Disable

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, I_o =Full Load

PCB Layout Guide

PCB layout is very important to achieve stable operation. It is highly recommended to duplicate EVB layout for optimum performance. If change is necessary, please follow these guidelines and take Figure 3 for reference.

- 1) Keep the path of switching current short and minimize the loop area formed by Input capacitor, IN pin and GND.
- 2) Bypass ceramic capacitors are suggested to be put close to the IN Pin.
- 3) Ensure all feedback connections are short and direct. Place the feedback resistors as close to the chip as possible.
- 4) VOUT, LX away from sensitive analog areas such as FB.
- 5) Connect IN, LX, and especially GND respectively to a large copper area to cool the chip to improve thermal performance and long-term reliability.
