

1、General Description

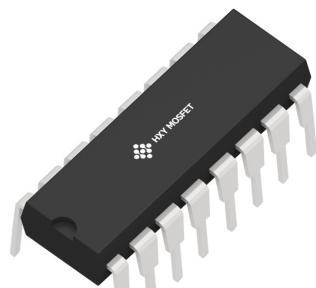

The 74HC165D,653/74HCT165D,653 is 8-bit serial or parallel-in/serial-out shift registers. The device features a serial data input (DS), eight parallel data inputs (D0 to D7) and two complementary serial outputs (Q7 and \bar{Q}_7). When the parallel load input (\bar{PL}) is LOW the data from D0 to D7 is loaded into the shift register asynchronously. When \bar{PL} is HIGH data enters the register serially at DS. When the clock enable input (\bar{CE}) is LOW data is shifted on the LOW-to-HIGH transitions of the CP input. A HIGH on \bar{CE} will disable the CP input. Inputs are overvoltage tolerant to 15V. This enables the device to be used in HIGH-to-LOW level shifting applications.

Note:

[1] t_{pd} is the same as t_{PLH} and t_{PHL} .

[2] t_t is the same as t_{THL} and t_{TLH} .

[3] C_{PD} is used to determine the dynamic power dissipation (P_D in uW).

$$P_D = (C_{PD} \times V_{CC}^2 \times f_i \times N) + \sum(C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i =input frequency in MHz;

f_o =output frequency in MHz;

C_L =output load capacitance in pF;

V_{CC} =supply voltage in V;

N=number of inputs switching;

$\sum(C_L \times V_{CC}^2 \times f_o)$ =sum of outputs.
