- Notes:
1. Load and line regulation are specified at constant junction temperature. Change in V_O because of heating effects is covered under the Thermal Regulation specification. Pulse testing with a low duty cycle is used.
 2. C_{ADJ} , when used, is connected between the adjustment pin and ground.
 3. Power dissipation within an IC voltage regulator produces a temperature gradient on the die, affecting individual IC components on the die. These effects can be minimized by proper integrated circuit design and layout techniques. Thermal Regulation is the effect of these temperature gradients on the output voltage and is expressed in percentage of output change per watt of power change in a specified time.
 4. Since Long Term Stability cannot be measured on each device before shipment, this specification is an engineering estimate of average stability from lot to lot.

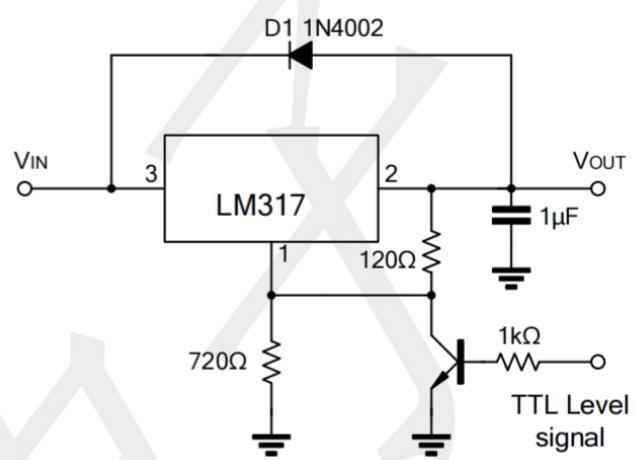

Typical Application Circuit

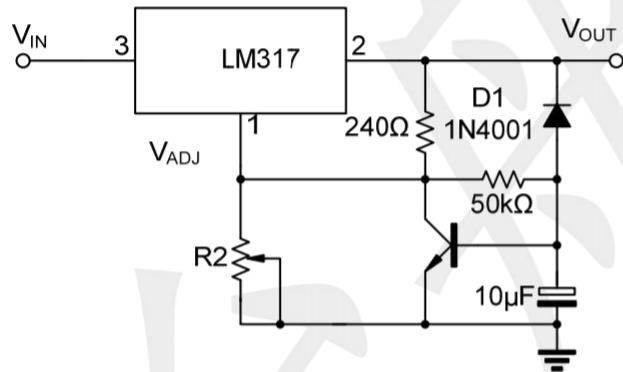

$$V_{OUT} = 1.25V \times (1 + R_2/R_1) + I_{ADJ} \times R_2$$

C_1 is required when regulator is located an appreciated distance from power supply. C_o is needed to improve transient response.

Soft Start Application

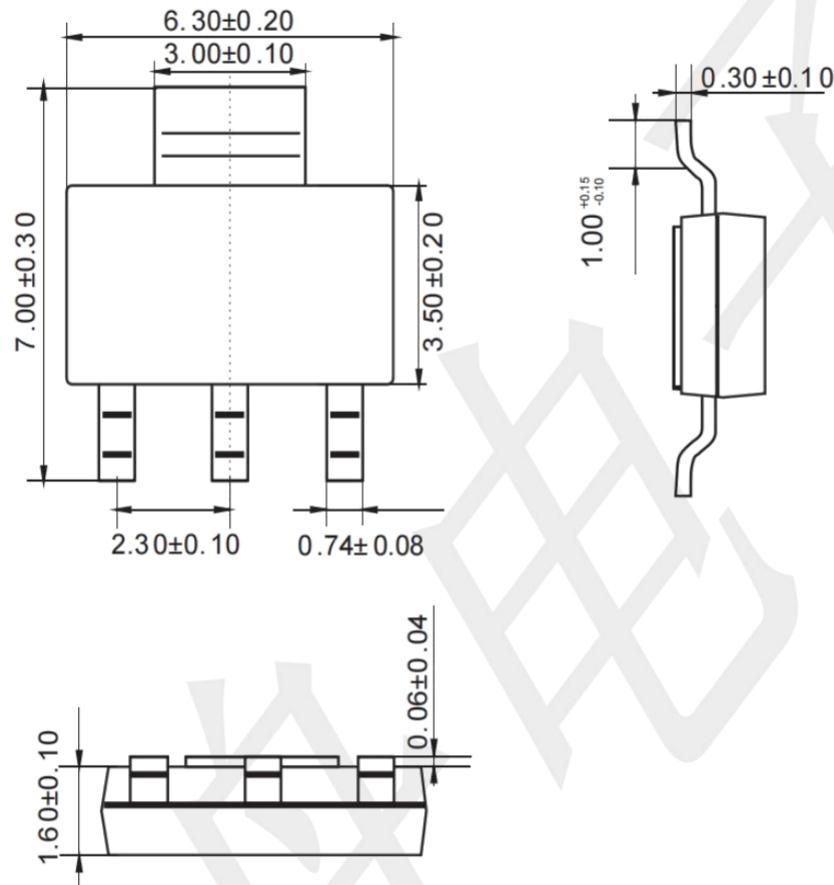

$$I_{O(MAX)} = \left(\frac{V_{REF}}{R_1} \right) + I_{ADJ} = \frac{1.25V}{R_1}$$

$$I_{O(MIN)} = \left(\frac{V_{REF}}{R_1+R_2} \right) + I_{ADJ} = \frac{1.25V}{R_1+R_2}$$
