

Features

- Very high speed: 45 ns
- Wide voltage range: 2.20 V to 3.60 V
- Pin compatible with CY62137CV30
- Ultra low standby power
 - Typical standby current: 1 μ A
 - Maximum standby current: 7 μ A
- Ultra low active power
 - Typical active current: 2 mA at f = 1 MHz
- Easy memory expansion with $\overline{CE}$ and $\overline{OE}$ features
- Automatic power-down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed and power
- Byte power-down feature
- Offered in Pb-free 48-ball very fine-pitch ball grid array (VFBGA) and 44-pin thin small outline package (TSOP II) package

Functional Description

The CY62137EV30 is a high performance CMOS static RAM organized as 128K words by 16 bits. This device features advanced circuit design to provide ultra low active current. This

is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption by 90% when addresses are not toggling. The device can also be put into standby mode reducing power consumption when deselected ($\overline{CE}$ HIGH or both BLE and BHE are HIGH). The input and output pins (I/O_0 through I/O_{15}) are placed in a high impedance state when: deselected ($\overline{CE}$ HIGH), outputs are disabled ($\overline{OE}$ HIGH), both Byte High Enable and Byte Low Enable are disabled (BHE, BLE HIGH), or during a write operation ($\overline{CE}$ LOW and WE LOW).

Writing to the device is accomplished by asserting Chip Enable ($\overline{CE}$) and Write Enable (WE) inputs LOW. If Byte Low Enable (BLE) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{16}). If Byte High Enable (BHE) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{16}).

Reading from the device is accomplished by asserting Chip Enable ($\overline{CE}$) and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins appears on I/O_0 to I/O_7 . If Byte High Enable (BHE) is LOW, then data from memory appears on I/O_8 to I/O_{15} . See the [Truth Table on page 11](#) for a complete description of read and write modes.

The CY62137EV30 is available in 48-ball VFBGA and 44-pin TSOPII packages.

Notes

1. NC pins are not connected on the die.
2. Pins D3, H1, G2, H6 and H3 in the 48-ball VFBGA package are address expansion pins for 4 Mb, 8 Mb, 16 Mb, and 32 Mb and 64 Mb respectively.
3. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC(typ)}, T_A = 25 °C.

Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Notes

4. V_{IL(min.)} = -2.0 V for pulse durations less than 20 ns.

5. V_{IH(max)} = V_{CC} + 0.75 V for pulse durations less than 20 ns.

6. Full device AC operation assumes a 100 μs ramp time from 0 to V_{CC(min)} and 200 μs wait time after V_{CC} stabilization.

7. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC(typ.)}, T_A = 25 °C.

8. Chip enable (CE) and byte enables (BHE and BLE) need to be tied to CMOS levels to meet the I_{SB1} / I_{SB2} / I_{CCDR} specification. Other inputs can be left floating.

Notes

10. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = V_{CC(typ.)}$, $T_A = 25\text{ }^\circ\text{C}$.
11. Chip enable ($\overline{CE}$) and byte enables ($\overline{BHE}$ and $\overline{BLE}$) need to be tied to CMOS levels to meet the I_{SB1} / I_{SB2} / I_{CCDR} specification. Other inputs can be left floating.
12. Tested initially and after any design or process changes that may affect these parameters.
13. Full device operation requires linear V_{CC} ramp from V_{DR} to $V_{CC(min.)} \geq 100\text{ }\mu\text{s}$ or stable at $V_{CC(min.)} \geq 100\text{ }\mu\text{s}$.
14. $\overline{BHE.BLE}$ is the AND of both $\overline{BHE}$ and $\overline{BLE}$. The chip can be deselected by either disabling the chip enable signals or by disabling both $\overline{BHE}$ and $\overline{BLE}$.

Notes

15. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns (1V/ns) or less, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in [Figure 3 on page 5](#).
16. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Notes [AN13842](#) and [AN66311](#). However, the issue has been fixed and in production now, and hence, these Application Notes are no longer applicable. They are available for download on our website as they contain information on the date code of the parts, beyond which the fix has been in production.
17. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
18. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
19. The internal write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE} = V_{IL}$, $\overline{BHE}$ and $\overline{BLE} = V_{IL}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.
20. The minimum pulse width for write cycle 3 ($\overline{WE}$ controlled, $\overline{OE}$ LOW) should be equal to the sum of t_{SD} and t_{HZWE} .

Switching Waveforms

Figure 6. Read Cycle No. 2: $\overline{OE}$ Controlled [22, 23]

Notes

21. The device is continuously selected. $\overline{OE}$, $\overline{CE} = V_{IL}$, $\overline{BHE}$ and $\overline{BLE} = V_{IL}$.
22. $\overline{WE}$ is HIGH for read cycle.
23. Address valid prior to or coincident with $\overline{CE}$ and $\overline{BHE}$, $\overline{BLE}$ transition LOW.

Figure 8. Write Cycle No. 2: $\overline{\text{CE}}$ Controlled [24, 25, 26]

Notes

24. The internal write time of the memory is defined by the overlap of $\overline{\text{WE}}$, $\overline{\text{CE}} = V_{IL}$, $\overline{\text{BHE}}$ and $\overline{\text{BLE}} = V_{IL}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

25. Data I/O is high impedance if $\overline{\text{OE}} = V_{IH}$.

26. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}} = V_{IH}$, the output remains in a high impedance state.

27. During this period, the I/Os are in output state and input signals should not be applied.

Notes

28. If $\overline{CE}$ goes HIGH simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.
29. During this period, the I/Os are in output state and input signals should not be applied.
