

General Description

The TP8204HS6-B is a fully integrated, high efficiency 3.0A synchronous rectified step-down converter. The TP8204HS6-B operates at high efficiency over a wide output current load range.

This device offers two operation modes, PWM control and PFM Mode switching control, which allows a high efficiency over the wider range of the load.

The TP8204HS6-B requires a minimum number of readily available standard external components and is available in a 6-pin

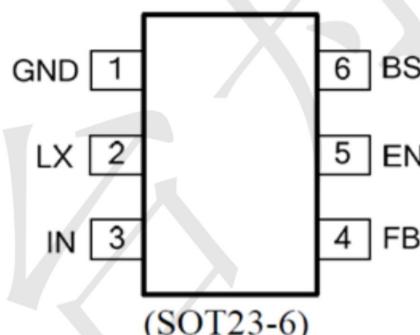

Features

- High Efficiency: Up to 96%
- 500KHz Frequency Operation
- 3A Output Current
- No Schottky Diode Required
- 4.5V to 17V Input Voltage Range
- 0.8V Reference
- Slope Compensated Current Mode Control for Excellent Line and Load Transient Response
- Integrated internal compensation
- Stable with Low ESR Ceramic Output
- Capacitors
- Over Current Protection with Hiccup-Mode
- Thermal Shutdown
- Inrush Current Limit and Soft Start
- Available in SOT23-6 Package
- -40°C to +85°C Temperature Range

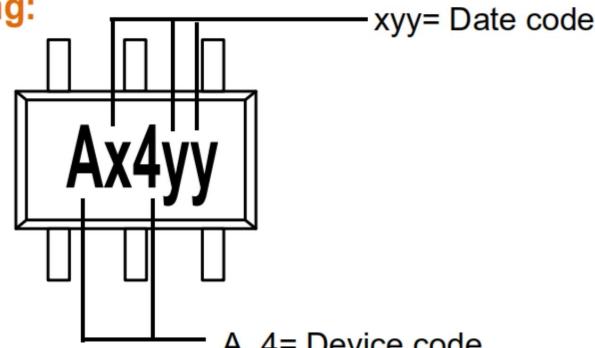

Applications

- Distributed Power Systems
- Digital Set Top Boxes
- Flat Panel Television and Monitors
- Wireless and DSL Modems
- Notebook Computer

PIN CONFIGURATION

Marking:

| PIN | NAME | FUNCTION |
|-----|------|--|
| 1 | GND | Ground |
| 2 | LX | Switching Pin |
| 3 | IN | Power supply Pin |
| 4 | FB | Adjustable version feedback input. Connect FB to the center point of the external resistor divider. |
| 5 | EN | Drive this pin to a logic-high to enable the IC. Drive to a logic-low to disable the IC and enter micro-power shutdown mode. |
| 6 | BS | Bootstrap. A capacitor connected between LX and BST pins is required to form a floating supply across the high-side switch driver. |

TYPICAL APPLICATION

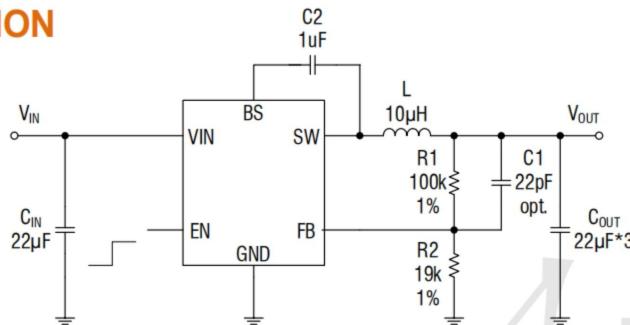

Figure 1. Basic Application Circuit

Setting the Output Voltage

The external resistor divider is used to set the output voltage (see Typical Application on page 1). The feedback resistor R1 also sets the feedback loop bandwidth with the internal compensation capacitor. Choose R1 to be around $100\text{k}\Omega$ for optimal transient response. R2 is then given by:

$$R_2 = \frac{R_1}{\frac{V_{OUT}}{V_{FB}} - 1}$$

Use a T-type network for when VOUT is low.

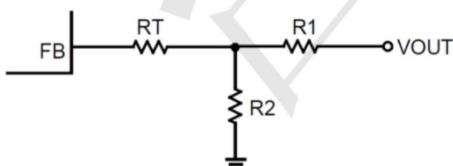

Figure 3: T-Type Network

Table 1 lists the recommended T-type resistors value for common output voltages.

| V_{OUT} | R_1 | R_2 |
|-----------|---------------------|----------------------|
| 1.2V | $100\text{k}\Omega$ | $200\text{k}\Omega$ |
| 1.8V | $100\text{k}\Omega$ | $78.7\text{k}\Omega$ |
| 2.5V | $100\text{k}\Omega$ | $46.4\text{k}\Omega$ |
| 3.3V | $100\text{k}\Omega$ | $31.6\text{k}\Omega$ |
| 5V | $100\text{k}\Omega$ | $18.7\text{k}\Omega$ |
