

GENERAL DESCRIPTION

The SGM6611C is a fully-integrated synchronous boost converter. The 2.7V to 12V operating input voltage is suitable for single-cell or two-cell Li-Ion/Polymer batteries. This device is capable to provide 7A continuous switch current and an output voltage range of 4.5V to 12.6V.

The SGM6611C has two operation modes, the pulse width modulation (PWM) mode and pulse frequency modulation (PFM). The PWM mode is applied at moderate to heavy load. The PFM mode is applied at light load to improve the efficiency. The protection features include output over-voltage protection at 13.2V, cycle-by-cycle over-current protection and thermal shutdown. The device also involves the functions of 4ms built-in soft-start and adjustable switch peak current limit.

The SGM6611C is available in a Green TQFN-2×2.5-11L package.

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

PIN CONFIGURATION

PIN DESCRIPTION

PIN	NAME	I/O	FUNCTION
1	NC	I	No Connection.
2	VCC	O	Output of the Internal Regulator. The VCC pin connects a ceramic capacitor ($> 1.0\mu\text{F}$) to ground.
3	FB	I	Output Voltage Feedback.
4	COMP	O	Output of the Internal Error Amplifier. Connect a loop compensation network between this pin and the GND pin.
5	GND	-	Ground.
6	VOUT	O	Boost Converter Output.
7	EN	I	Enable Logic Input. Logic high makes the circuit enabled, and logic low makes it disabled and the device enters shutdown mode.
8	ILIM	O	Adjustable Switch Peak Current Limit. Connect an external resistor between this pin and the GND pin.
9	VIN	I	IC Power Supply Input.
10	BOOT	O	Power Supply for High-side MOSFET Gate Driver. Strongly recommend to connect a capacitor between this pin and the SW pin.
11	SW	I	The Switching Node Pin of the Converter. Connect to the drain of the internal low-side power MOSFET and the source of the internal high-side power MOSFET.

NOTE: I = input, O = output.
